The most popular Christmas flowering plant this year in America has been the Cyclamen; prices of these and all other plants were dearer than ever before known here. Many plants sold wholesale at 30s. to 50s. each. Some of these were in small tubs; all were raised from seeds sown in August, 1917. Begonias came second in favour with largest sales of Glory of Cincinnati; the older Gloire de Lorraine sold in more limited numbers, but Melior, a little paler and poorer in colour than Cincinnati, with somewhat cup-shaped flowers, sold remarkably well, and promises to outclass all others here in the near future. Mrs. Peterson, with bronze foliage and deeper-coloured flowers, also sold well: this variety was raised by Mr. J. A. Peterson, of Cincinnati, Ohio, the raiser of Glory of Cincinnati. Gloire de Chatelaine does not realise such high prices as the others. One or two growers who had been able to propagate Optima, Mrs. Heal, and other English winter-flowering hybrids, were able to obtain fancy prices for them. Azaleas were less in evidence this year than usual, owing to the stoppage of Belgian importations, but Poinsettias made up in pans had a big sale. Erica melanthera, grown in 6-inch pots up to large tub sizes, sold well, also Euphorbia jacquinæflora. Numerous pots and pans of well-flowered Freesia Purity were in evidence, also Paper White Narcissus, but owing to the late arrival of Dutch bulbs there were no Tulips or Daffodils this year. Otaheite Oranges sold in great numbers, also Ardisia crenulata, the three and four-year-old plants being speedily cleared out. Amongst cheaper berried plants Solanum capsicastrum and Chinese Peppers had a large sale, while of the more common flowering plants, Primula chinensis in bright colours, P. malacoides and P. obconica were much in evidence. Many retail stores refuse, however, to handle the last-named, owing to its poisonous properties. Crotons, coloured Dracænas, Pandanus, Palms, Ferns, and made-up dishes, hampers and baskets of coloured-leaved plants and berries also sold well. Altogether it was a wonderful Christmas; everything was sold, and prices were the highest ever made. In cut flowers extreme high prices also prevailed, as while the demand was great, the supply was much below former years, owing to growers being allowed but 50 per cent. of their former year's quota of fuel. Since the termination of the war growers can purchase all the coal they need. Clear skies and abnormally high temperatures, with an almost entire absence of frost and snow, greatly favoured the cultivation of plants, including those for cut blooms, all over the American continent last season.

TO PREVENT ROOKS EATING CORN (MAIZE) SEED.

Some time ago in Mr. Molyneux's always interesting Home Farm Notes I noted some remarks on the need of protecting seeds from the attacks of birds. Here, where crows and English pheasants are often very troublesome, we find it necessary to "doctor" all our peas, corn and oats. Our method is to put, say, a bushel of seed at a time in a square box or barrel, drop a little coal tar here and there over the seeds, stir them vigorously for half a minute with a stick until some of the tar has reached all the seeds, then scatter a few handfuls of unslaked lime over the seeds and again stir vigorously. The lime will absorb all moisture from the tar, and the seeds can be sown by hand or through a seeder. Crows or pheasants leave these treated seeds severely alone, and the small amount of tar used in no way affects their germinating qualities. *W. N. Craig. Faulkner Farm, Brookline, Mass., U.S.A.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Chysis.—Such species of Chysis as C. aurea, C. bractescens, C. laevis, C. Limminghii, and the hybrids C. Chelsonii, C. langleyensis, and C. Sedenii, are well worth cultivating for the beauty of their flowers. Since the pseudo-bulbs matured last autumn, these Orchids will have been resting, but now they will require careful attention. Upon the first indication of growth, accompanied by the development of the flower-spikes, keep the plants rather moister than hitherto, and, if possible, provide a little more warmth. If any of the plants require repotting, the best time to do the work is as soon as new growth is evident. Adequate drainage should be provided. The compost in which they thrive best consists of peat or A1-fibre, fibrous loam, and Sphagnum moss in equal parts. Care must, however, be taken to remove the earthy matter from the loam and to use the fibrous portion only. Chysis delight in an abundance of light and free ventilation, and during their season of active growth enjoy strong sun-heat and plenty of moisture at the roots and in the atmosphere. The warmer end of the Cattleya house usually suits them admirably. The plants are best grown hanging from the roof-rafters, and Teak-wood baskets are the best receptacles for them.

Mexican Laelias.—At the present time the various Mexican Laelias are not held in high esteem by the majority of Orchid growers, yet in the whole family of Orchids there are few others that have more beautiful flowers. L. anceps, L. autumnalis and L. Gouldiana are worthy of a place in any collection, for although the delicate flowers are readily injured by fog and dull atmospheric conditions, yet where the plants can be grown and flowered satisfactorily they are grand for mid-winter display. These Laelias are the easiest of Orchids to manage, if placed in the cooler end of the Cattleya house, or in a house having a temperature intermediate between the Cattleya and the cool house. In either position they will do well, provided they receive a liberal supply of air whenever the outside conditions permit of ventilating, and very little shading is required at any time. The longer the plants are rested after flowering, the better will be the chance of obtaining satisfactory flowering growths the following season. To accomplish this end, afford the plants only sufficient moisture to keep the pseudo-bulbs plump, and the roots, which are active during this stage, in a healthy condition. These plants are sometimes grown in pots on the stage, but I prefer suspending them from the roof-rafters, in baskets, unless the position given them is exceptionally light. Even so, the plants have more air moving about then when suspended than when standing more or less closely together on the stage.

Trichopilia. — The beautiful and fragrant species T. suavis is fast sending up its flower spikes, which develop from the base of the lower side of the pseudo-bulbs, often in contact with the rooting material. The soil about the roots should be kept just moist, but not saturated, and care is necessary in giving water that it does not reach the advancing flower stems, or they will be very liable to rot; the same remark is true of T. coccinea and T. crispa, although they are not quite so impatient of moisture as the first-named. The varieties of T. tortilis are later in flowering, and should be kept all but dry at the root for some time to come.

Repotting.—The present is a suitable time for a general examination of Mexican Laelias, giving them new compost where necessary, and putting them in order for the growing season. The last made pseudo-bulbs should be about to produce a cluster of new roots if the plants are in suitable quarters. Specimens that commence rooting and growing in mid-winter are usually those that have been kept too warm and close. The members of this group of Lealias do not take kindly to root disturbance, therefore never repot or re-basket them unless the state of the compost necessitates it. The receptacles should be large rather than small in regard to the size of the plants, as this admits of their being left for at least two years without further root disturbance. These Orchids do not need a great mass of rooting material, but free drainage is essential. The draininge material should occupy about two-thirds of the depth of the pot or pan. The compost may consist of Osmunda, or A1 fibre, three parts, Polypodium fibre one part, and Sphagnum moss one part, the material being well mixed together. Press the compost moderately firmly about the roots, and finish with a surface layer of pure Osmunda or A1 fibre.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq., Wolverstone Park Gardens, Ipswich.

Figs.—Fig trees with young fruits swelling should be grown in a night temperature of 60° to 65°, with 10° higher by day. Syringe the plants thoroughly when the weather is favourable, and maintain a larger amount of atmospheric moisture. Whether the trees are grown in pots or borders, an abundance of water should be given the roots as growth advances. The Fig is a gross feeder, and quickly exhausts the nutriment contained in a restricted rooting area, therefore all trees, whether growing in pots or in small borders, should be freely supplied with food. Trees grown in pots may be further assisted, when carrying heavy crops of fruit, by top-dressings of fibrous loam and well-rotted dung. To enable this top-dressing to be laid on the surface, strips of zinc long enough to encircle the soil and about 4 inches deep should be placed just within the rim of the pot, the added compost being firmly rammed. Great care must be exercised in watering until the roots have grown into the fresh soil. Attend to the disbudding and stopping of the shoots, to prevent overcrowding of the growths: extra vigorous shoots should be pinched at an early stage or the young fruits will be liable to drop. All suckers should be removed immediately they develop.

Planting Vines.—Where it is intended to plant vines, and the borders have already been prepared for the roots, the sooner the work is done the better. If the vines are intended for early forcing, it is a great advantage to allow them a long season of growth. The distance between the rods is usually governed by the rafters of the house, as it is between these that the rods are trained. In a first-early vinery a distance of 4 feet between the rods will suffice; for vines in successional and late houses allow a distance of 4 feet 6 inches to 5 feet; the last-named distance is best for vines in a late house. When the vines are turned out of the pots, soak the ball in water and carefully remove all the soil from the roots. This done, spread the roots out evenly in all directions in a previously prepared hole, 5 to 6 inches in depth, and of suitable width to accommodate the roots without crowding them. Cover the latter with soil and make it firm. If the border is reasonably moist, water will not be required for some time to come. After planting, many cultivators shorten the rod to two or three eyes near the base, leaving ultimately the strongest shoot that develops. Another method is to shorten the rod to 4 or 5 feet and then rub off the buds by degrees as they burst into growth, until the most suitable growth near the base is reached. This shoot should be allowed to grow unchecked to a length of 5 feet and then stopped, allowing the subsequent leading growth to extend the full length of the roof before stopping it. Free growth should be encouraged by maintaining a moist atmosphere, and a temperature of 50° by night, and 55° to 60° during the day. Admit air whenever the weather permits.

Tomatos.—Fruiting plants should be assisted to mature the later fruits by gathering at an early date those that ripen, and giving the roots light top-dressings of fresh compost, and weak

applications of liquid manure or a suitable artificial fertiliser at each alternate watering. Do not keep the soil excessively moist. Maintain a night temperature of about 60°, with a suitable rise by day with sun heat. Ventilate the house freely on all favourable occasions. Successional plants should be planted out or placed in their fruiting pots as soon as they have set their first trusses. For compost, use rich loam, to which fine mortar rubble and wood ash have been added liberally, also a good sprinkling of bone-flour. When potted, place the plants in a light house near the roof-glass. Pollinate the blooms every day, and remove lateral growth regularly. If white fly proves troublesome, vaporise the house at necessary intervals. Young plants of later batches should not be allowed to become root-bound, but shifted into larger pots or boxes when necessary. Seed may be sown if fresh plants are required.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Maincrop Onions.—Whenever the ground reserved for this important crop is in a suitably friable condition, prepare the seed bed and sow the seed forthwith. The ground will need only a little attention provided it has been trenched as advised in a previous calendar. Simply break the surface down with a fork, level it and make it firm. Rake away all coarse stones, square the bed, and then draw drills 14 inches apart, and an inch in depth. After covering the seeds, rake the surface parallel with the drills. A wooden rake is preferable to an iron implement, as it leaves the surface somewhat rougher, which is an advantage on heavy soils which harden and cake readily, preventing a free growth of the seedlings. In sowing maincrop Onions, do not overlook the merits of the variety James's Long Keeping.

Tomatos for Outdoor Cropping.—The failure of Tomatos out of doors is more often due to late sowing than to any other cause. The seed should be sown at this date, preferably in boxes, about 4 inches in depth, filled with compost consisting of equal parts of loam, sand, and finely sifted leaf-mould. Fill the boxes with the soil pressed firmly to within an inch of the top. Level the surface with a wooden block, and sow the seeds at 1½ inch apart. In this way strong, sturdy plants will be obtained for potting, first into 60-sized pots, and later into those of 48 size. The smaller fruiting varieties, including Bide's Recruit, Model and Sunrise, are to be preferred to the larger sorts.

Maincrop Celery.—During the coming week the main sowing of Celery is usually made. Sow in boxes filled with soil of a light, sandy nature, make the compost firm, fine and very level on the surface. Sow the seeds thinly, and just cover them with finely-sifted soil. Water the latter and place the boxes in gentle warmth. Cover the box with paper until the seeds germinate, then gradually admit light and air. Aldenham Pink, Aldenham White, Sulham Prize, and Standard Bearer for late use are all grand varieties. Seedlings of Celery from an earlier sowing require pricking off. Use sandy loam as a compost, and continue to grow the plants in gentle warmth, attending carefully to such details as watering and airing, as a check from any cause is harmful.

Beetroot.—Where a mild hotbed is at command, a sowing of Globe Beet may be made. Draw drills at 9 inches apart, and one inch in depth. Keep the lights closed until germination takes place, then admit air during the early noon. Radishes and early Lettuce may be sown broadcast, thinly, on the bed, as catch-crops.

The Frame-yard.—All plants in the frame-yard need constant attention, including careful watering and full exposure to sunlight during the brighter part of the day. These remarks apply to autumn-sown Cauliflowers and Globe Artichokes, which require to be well hardened preparatory to being planted in their final quarters.

PLANTS UNDER GLASS.

By James Whitock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Palms.—The present is a suitable time to attend to the requirements of Palms. Large specimens in a healthy condition may be retained in the same pots or tubs for several years, provided the drainage is perfect and the roots are given a top dressing of good loam mixed with a plant fertiliser. Water the roots with liquid manure on frequent occasions throughout the summer. Plants to be re-potted should be placed in well-drained pots, using heavy loam, leaf-mould and sand, enriched with plant fertiliser, as compost. Keep the plants free from scale insects by syringing them weekly with an insecticide, and the following morning with clean water. Cocos Weddelliana, Kentias and Phœnix Roebelinii are suitable for growing as small decorative plants.

Salvia splendens.—This scarlet-flowered Sage is useful for autumn decoration. If old plants are placed in a warm house, and syringed they will produce shoots suitable for cuttings, which may be inserted close to the edges of pots and plunged in bottom heat. When rooted, pot the plants singly in small pots, and transfer them later to pots large enough for them to flower in. The soil should consist of a mixture of good loam, leaf-mould, and concentrated fertiliser. Syringe the foliage frequently with diluted clear soot water, to keep down red spider. Other plants, grown for autumn flowering—including Hibiscus and Abutilon—may be pruned and top-dressed, or re-potted in a mixture of loam, leaf-mould, and artificial manure.

Rhododendron indicum (Indian Azaleas).—As the early-forced varieties of Azaleas finish flowering, remove all remnants of the flowers. It is not necessary to re-pot the plants every year, it being desirable to retain them in as small pots as possible. In affording top-dressings, remove the surface soil with a sharp-pointed stick, and substitute fibrous peat and a little fertiliser. In re-potting, use clean, well-drained pots; the soil should consist of three-fourths peat and one-fourth loam, and silver-sand added. Prick over the surface of the ball, and in potting ram the soil firm with a stick. Place the plants in a warm house, where they will make new growth, and syringe them daily—sometimes with an insecticide—to destroy thrips and other insects. Continue this treatment until the flower buds are set, when the plants should be removed to cooler quarters. It is important they should not become excessively dry at the roots.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park Gardens, Barnet, Hertfordshire.

Sweet Peas.—In favourable weather, and when the land is in a suitable condition, make a liberal sowing of Sweet Peas, in well-prepared trenches containing plenty of decayed manure, sweet loam, and other suitable materials, to encourage the development of large flowers. Select a good situation, do not sow the seed too thickly, and adopt measures to prevent injury by mice, slugs and sparrows. The birds are very destructive to the young plants. Plants raised from seed sown in autumn need supports at an early stage, and a little protection should be afforded them in cold weather and when keen winds blow.

Spring Bedding Plants.—Now that the snow has disappeared many plants will be on the move. Examine the beds carefully and make good any deficiencies that have arisen. Lift the roots of Wallflowers, Forget-me-nots, Alyssums, and similar flowers, with good balls of soil adhering; plant them firmly; and if the soil is wet and sticky place a little fresh fine, dry soil around the roots, before pressing the latter in position.

Tidying the Beds.—Take advantage of fine weather, as soon as the soil is moderately dry and workable, to clean and freshen the surface soil amongst all growing plants, with a view to making the beds neat and tidy.

Plants in Frames.—Pentstemons and Calceolarias that were rooted under glass last autumn may be lifted, and transplanted where glass protection may still be afforded them until they have made more growth. Set the plants three or four inches apart, in rather firm sandy soil and leaf-mould, water to settle the soil, ventilate the frames more or less according to the state of the weather, and slightly shade for a few hours during bright sunshine.

Pansies and Violas.—Should the action of frost have displaced any of the Viola or Pansy plants, press the soil firmly about their roots, and make good any failures. As soon as the soil is in good condition plant freely from the stock beds clumps intended for summer flowering, in order that they may become well established early.

Gravel Footpaths.—To keep gravel footpaths firm and solid, very slightly sprinkle the surface with fresh material and press it in firmly with the roller when the path is moist. A very light sprinkling of gravel annually, if rolled in when wet, will serve to keep the surface quite firm and hard during the summer.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Pruning.—The science and art of pruning fruit trees consists chiefly in understanding the nature and modes of bearing of the different varieties of trees, their habits, the manner in which they produce their shoots and branches, and also, in removing parts of a tree, whether roots, stem, or branches, with the object of checking growth in one direction and causing the sap to be directed into another, where the shoots are well placed. No hard-and-fast rules can be laid down as to method of procedure, as this is governed by circumstances which can only be decided on the spot, and from personal observation. The results of pruning vary very much, according to the time and manner in which the work is carried out. Large numbers of trees are spoilt by a too free use of the knife, whilst on the contrary many are ruined by neglect to prune.

Summer Pruning.—Pruning may be classed under three headings—viz., summer, winter, and root pruning. All have for their object the production of fruitful wood, and the diversion of the sap from too vigorous to weak shoots. Summer pruning is the most important, but is often neglected through want of time. Where a proper system of summer pruning is adopted, time is saved in winter, and the work done at a much more pleasant season. The leaves being on the trees the operator has a better opportunity of estimating the amount of wood that should be cut out. If strong, vigorous shoots are not removed until the winter, the sap is not equally distributed over the tree at the time when growth is most active, and in consequence as strong or even stronger shoots develop the following spring from where the cut is made. Most trees complete their maximum amount of growth by the middle of July, and this is generally the best time to summer prune; but it is better to be a trifle late rather than too early, for if the work is done too soon there would be a danger of the dormant buds pushing into growth. When summer pruning is deferred too late in the season, the buds do not mature so well, owing to shade from the crowded growth.

Winter Pruning.—In winter, all weak wood should be cut back to two or three buds, and all dead and unripened wood cut away. Pruning is best done early, as it gives the trees a better chance of developing wood and fruit buds, whereas late pruning has a tendency to produce stagnation in bad seasons and cause canker and gumming. Fully-grown trees merely need restricting to a suitable size, and spurs that are getting overcrowded should be cut out. Young trees intended to be trained in a particular form should have all leading growths kept at about one level, otherwise the stronger growths will appropriate the sap from the weaker ones. Trees making extra strong growths should be root pruned, as no amount of top pruning will check them.

Winter Spraying.—The spraying of fruit trees with caustic specifics should be completed by the second week in March.

EDITORIAL NOTICE.

Special Notice to Correspondents. *The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, MARCH 10—
United Hort. Ben. and Prov. Soc. Ann. meet. at Roy. Hort. Soc. Hall. Bath Gard. Soc. meet.

TUESDAY, MARCH 11—
Roy. Hort. Soc. Coms. meet: Open class for early flowering bulbs in pots. Lecture by Mr. James Whitton at 3 p.m. on "The Glasgow Public Parks."

WEDNESDAY, MARCH 12—
Wargrave Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 41.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, March 5, 10 a.m.: Bar. 29.7; temp. 50°. Weather—Rainy.

The National Village Centres for Disabled Men. The Village Centres Council, which has offices at 5, Little College Street, Westminster, is actively engaged in establishing in rural districts colonies for training disabled ex-service men during the period whilst they still require medical treatment, but after they have reached a stage of recovery when the men are capable of taking up work with a view to returning to the normal civil and normal country pursuits. The Ministry of Pensions lends support to schemes of which it approves, and have promised grants in aid of men whilst undergoing treatment in training; but the Council, in order to carry out its programme, needs further financial assistance.

The first village centre is being established near Andover, in Hampshire, where the Enham Estate, of over 1,000 acres, has been purchased (see Figs. 113, 114). It is proposed to train about 1,000 men there. Building operations are now in active progress at Enham Place, where it is hoped that the first fifty men will be in residence in the course of a month.

The trustees of the Red Cross are providing funds for the building of the hospital, which is expected to cost £10,000, and a number of hospitals which are being closed are giving furniture and equipment. H.M. The King has subscribed 100 guineas to the fund, and the trustees of the King's Fund will make grants to men who, having undergone treatment and training at Enham, are competent to take up small holdings, or have become qualified to set up in industries for which they have been trained at the Centres. Mr. Cheal, of Crawley, is chairman of the Agricultural and Horticultural Committee of Management of the Enham Centre, and the members of the committee include Mr. James Hudson, V.M.H.; Mr. W. H. Divers, V.M.H.; and Mr. G. P. Berry, of the Board of Agriculture. The committee have inspected the estate, and have reported that they regard the site as suitable for the purpose to which it is to be put.

Agricultural and horticultural training will be provided, and will include not only practical work, but also courses of lectures and demonstrations. In addition, instruction under the direction of Mr. Crisp, who has been appointed Horticultural Superintendent, will be given in carpentry, smith and wheelwright work, poultry and bee-keeping and other village industries. It is much to be desired that the Ministry of Pensions should publish facts indicating the success which has already been achieved in training men in various trades; for the public would be greatly encouraged to co-operate in this admirable work could they but have evidence—which we know is forthcoming—to show that partly disabled men, with no previous technical training, are making good in a surprisingly successful manner in some of the crafts in which they have been trained. It is too often assumed, for example, that a man is, say, a labourer because he is fit only for unskilled work, yet instances have come to our notice of such men, who, after training in a technical school, have been able to go into workhops and do skilled work so well that in the course of a few months they could earn the current rate of wages. We suggest, therefore, to the Ministry of Pensions that it should put dispassionately the evidence which it is accumulating, of the teachableness of the partially disabled, at the disposal of the public, who, we are sure, will take the keenest and most sympathetic interest in the progress of this beneficent work.

With respect to the centre at Enham, Mr. Cheal would be glad to give every information to those who would like to know more of the scheme of horticultural training which is to be carried out at this centre.

The forms which assistance can take are various—a donor can assume financial responsibility for the initial cost of one, or more—or many acres. Those who wish to perform a good deed and to keep alive the memory of a fallen relative, or to show thanks for one who has been restored to them may endow and name a hospital bed, or provide a cottage, many of which will be required when the scheme is in full development.

R.H.S. Teachers' Examination.—The Board of Examiners of the Royal Horticultural Society have recommended, and the President and Council have adopted the recommendation, that candidates taking the society's honours examination of the R.H.S. Teachers' Examination in School and Cottage Gardening can substitute a "Pass with Distinction," or a "Pass with Credit" in the Gardening Examination of the Board of Education for Teachers in Training, for the R.H.S. Preliminary Examination of the Teachers' Examination in School and Cottage Gardening. That is to say, a candidate with a Pass with Distinction, or with Credit, can take the Honours Examination without having passed the R.H.S. Preliminary Examination. The Teachers' Honours Practical Examination will be held during the week commencing June 23.

National Rose Society's Exhibitions in 1919.—The National Rose Society will held its Spring Exhibition at the London Scottish Drill Hall, Westminster, on Tuesday, April 29; the Summer Show takes place at the Botanic Gardens, Regent's Park, N.W., on Wednesday, July 2; the Provincial Show will be held at Norwich on Thursday, July 10; and the Autumn Meeting at the London Scottish Drill Hall on Tuesday, September 9.

York Gala.—The schedule of the York Gala, which will be held on June 18, 19, and 20, makes special provision for groups of plants, and liberal prizes are offered to both amateurs and traders in this section. In these classes exhibitors are not permitted to use staging of any kind, as it is intended that the exhibits may be viewed from all aspects. The schedule also includes classes for Orchids, stove and greenhouse plants, hardy herbaceous plants, alpines and aquatics. Several classes are allotted to Roses, and there are also numerous classes for hardy flowers, and a section for floral decorations. Vegetables will be represented as usual, but the fruit classes have been omitted on this occasion, as the committee realises that owing to the shortage of fuel and labour the cultivation of indoor fruits of an exhibition standard has not been possible in the majority of establishments. York Gala is one of the first of the large provincial exhibitions to resume activities, and we wish the show a great success.

Michael Foster Research Studentship at Cambridge University.—An offer has been made by Dr. J. B. Hurry, Westfield, Reading, to increase the value of the Michael Foster Research Studentship from 100 guineas to £200.

Diploma Examination in Horticulture.—It has been decided by the Royal Horticultural Society's Board of Examiners that the Practical Diploma Examinations shall be held during the week commencing September 22, 1919, and not in June as in past years. The Written Diploma Examination will take place on September 6.

Land Settlement for ex-Service Men and Farm Tenants. The President of the Board of Agriculture makes a special appeal to landowners to offer to the Board, or to the County Councils, any areas of land suitable for settlement, of which vacant possession can be given at an early date. A considerable quantity of land is in the market, but most of it is in the occupation of sitting tenants who are not under notice to quit, and consequently vacant possession cannot be obtained before Lady Day or Michaelmas, 1920. In meeting the large demand for land from ex-service men it would, therefore, be of great assistance if landowners would notify the Board or the County Council of any farms which will come in hand during the present year, and give them an opportunity of considering them before accepting a new farm tenant. It would also be of great assistance if landowners would, by arrangement with their farm tenants, offer to the County Councils immediate possession of land, convenient of access, on which cottages could be built, each with at least an acre of land.

Lea Valley Nurserymen's Association.—The Lea Valley Association's fourth annual dinner, arranged for Friday, February 7, at the Abercorn Rooms, Liverpool Street Hotel, was postponed owing to the railway strike. The date now fixed is Friday, March 7, and the dinner is to be held at the same time and place as previously arranged.

Notes from Belgium.—M. Theodore Pauwels sends us the following letter from Meirelbeke, Ghent:—Belgian horticulturists have experienced very hard times during the war, and it will take years and a great amount of energy to bring Ghent horticulture to the degree of splendour it had reached in 1914. Most horticulturists have suffered from lack of fuel; others have seen their establishments and plants destroyed by bombs and by explosions from the destruction of railways and bridges, and also by artillery fire. My Orchid nursery was entirely destroyed by the artillery during the last battle that took place before Ghent on November 8, 9, and 10, 1918. No fewer than 60 howitzers were directed upon my house and Orchid houses, and of the 3,000 square metres devoted to Orchid culture only three houses were saved. Thousands of Cattleya, Odontoglossum, Cymbidium and Cypripedium hybrids, most of them ready to flower for the first time, and the result of twenty-five years' work, were destroyed in a few minutes. I had the great honour to receive yesterday

(February 21) a visit from His Majesty King Albert, who wished to see the immense damage caused by the Hun army to Belgian industries.

Tehidy Mansion Destroyed by Fire.—The stately and beautiful mansion of Tehidy, Cornwall, was burnt to the ground during the early hours of the 26th ult. Tehidy is stated to have been the home of the Basset family for 800 years, and was probably, from an interior standpoint, the most beautiful mansion in Cornwall. Italian artists were engaged to carry out a scheme of beautifying the place; the ceilings and walls were ornamented with delicate designs and beautiful pictures. Apart from the sentimental aspect, the loss of the building is a calamity for Cornwall. During the summer of 1918 the house, with some hundreds of acres of park lands and woods, was acquired by the Cornwall County Council as a war memorial, to be adapted as a sanatorium for the treatment of tubercular diseases, at a cost of about £20,000. This amount was raised by public subscription, and the work of adaptation was so near completion that five patients and a staff were in residence only three or four days before the fire occurred. Happily no lives were lost, but little else was saved beyond the conservatory. Tehidy was handsomely situated, well wooded, and within a few minutes' walk of the sea on the North coast. Several generations of the former owners had spent large sums in beautifying the gardens and pleasure grounds, which were amongst the finest in the county.

Two Interesting Lycopods.—Only a few members of the Lycopod family, notably in the Selaginella group, are sometimes utilised in the gardens of this country, but to the student of plant history the Lycopod family is one of supreme interest, as it represents a once great and glorious line of ancient plants. The Lycopods played a leading part in the coal-measure forests, and of the coal with which the gardener may be heating his exotics to-day possibly 30 to 40 per cent. of the substance of which it consists was contributed by extinct Lycopod trees. The Lycopod group is now dwindling, and contains little but small and unimpressive herbs, but the genera which are still living are extremely widespread, and it appears that just one or two descendants of these ancient stocks are to be found native in most countries of the world. When the British Association met in 1914 in Australia, just before the war, Professor Bower, in his presidential address, said that "the most peculiar living Lycopods are certainly Isoëtes and Phylloglossum." When he was speaking in Sydney neither of these two genera had yet been discovered in the South Australian flora, so that it is interesting now to find (in *The Transactions of the Royal Society of South Australia*, Vol. XLII, 1918) a note on the discovery of both these genera in the South Australian flora, the particularly curious point being that the two genera are growing side by side in a specialised flora of native plants. The species are Isoëtes Drummondii and Phylloglossum Drummondii, another curious coincidence. Professor Osborn, of Adelaide University, describes the curious root development of both these plants, and gives a diagram showing the root position in the soil in relation to the other members of the community with which they live. This community consists of highly specialised seasonal swamp plants on alluvial sands.

Fertilisers.—The supply of fertilisers generally for the current season is much greater than it was last year, but considerable difficulties still exist in regard to transport, and prompt delivery cannot therefore be assured. The prices prescribed by the Fertiliser Prices Order for sulphate of ammonia, superphosphate and basic slag will remain unchanged up to June 1 next. Arrangements have been made for the importation of a considerable quantity of phosphate rock. The demand for basic slag at the present time is greatly in excess of the production, but the total output for the whole season is likely to be about one-fifth more than it was in 1917-18. Sulphate of ammonia is available in greater quantities than last year. It is understood that a number of makers have bone-meal and bone-flour for sale at lower prices than those ruling a few months ago, and immediate delivery of these materials can probably be obtained.

The Late Professor Cogniaux.—The late Alfred Celestin Cogniaux, whose death occurred so long ago as April 15, 1916, was for many years a visitor to this country, though he was scarcely known outside of Kew and the Natural History Museum on account of his inability to converse in English and his devotion to work. In consequence of the war no adequate memoir of him has been published in this country, and the following account of his work will be read with interest. Alfred Cogniaux, as he was generally known, was born on April 7, 1841, at Robechies, in Hainault, Belgium. The earlier years of his active career were mainly devoted to teaching, but later he became a prolific contributor to descriptive botany, including garden botany. He specialised in a few families beginning with the Cucurbitaceae and continuing with the Melastomaceae, but the latter part of his life was devoted mainly to the Orchidaceae, more especially the Orchids of Brazil and neighbouring countries. His first contribution of importance to systematic botany is an account of the Cucurbitaceae of Brazil, which appeared in Martin's *Flora Braziliensis* (1878), and this was followed by a monograph of the whole family in De Candolle's Monographs. To the same great work (*Fl. Bras.*) Cogniaux contributed the Melastomaceae, which find their greatest concentration in Brazil, the numbers being 978 species (of which 800 are peculiar), belonging to 58 genera (of which 19 are endemic). This was followed by a monograph of the whole family in 1891, which included descriptions and history of 2,702 species, whereof 757 were described as new. It may be of sufficient interest to give more detailed particulars of his contributions to the literature of Orchids. In the first place came the Orchids of Brazil, which appeared in parts between 1893 and 1906. Including 319 species from adjoining countries, the total number of species described is 1,795, belonging to 109 genera, and illustrated by 372 folio plates. The genera, containing more than 25 species, are thirteen, as follows: Pleurothallis, 214 species, of which 198 species are endemic; Epidendrum, 129 species, of which 89 are endemic; Oncidium, 107 species, of which 86 are endemic; Habenaria, 91 species, of which 65 are endemic; Maxillaria, 62 species, of which 50 are endemic; Octomeria, 50 species of which 47 are endemic; Spiranthus, 46 species, of which 30 are endemic; Catasetum, 44 species, of which 34 are endemic; Stelis, 44 species, of which 41 are endemic; Bulbophyllum, 36 species, of which 35 are endemic; Stenorrhyncus, 36 species, of which 26 are endemic; Cattleya, 33 species, of which 28 are endemic; Pogonia, 29 species, of which 27 are endemic. About 140 genera of Orchids are represented in the Brazilian flora, including the following peculiar types: Acacallis, Centroglossa, Chaenanthe, Chytroglossa, Cirrhaea, Dipteranthus, Gomeza, Grobya, Izabelia, Leptotes, Paradisanthus, Phymatidium, Platyrhiza, Pogoniopsis, Quekettia, Sanderella, Saundersia, Sophronitis, Warmingia. Cogniaux also contributed a very elaborate monograph of West Indian Orchids to Urban's *Symbolae Antillanae*. This comprised upwards of 500 species belonging to 96 genera. But the work by which Cogniaux was best known to horticulturists is the *Dictionnaire Iconographique des Orchidées*, which he published in conjunction with the Belgian botanical artist, A. Goossens; a duodecimo, issued in 64 parts (1897-1907). This excellent work, devoted to cultivated Orchids, comprises 832 excellent plates in chromo-lithography. As a supplement to this work, a descriptive publication, entitled *Chronique Orchidéenne*, appeared in corresponding numbers during the same period. He also described a large number of new species in J. Linden's *Journal des Orchidées*. This ended his activity in Orchids, when he again took up the Cucurbitaceae and Melastomaceae, as we learn from a very sympathetic memoir of the deceased botanist by Dr. R. Schlechter, which appeared in *Orchis*, 1916, with an excellent portrait. Cogniaux was engaged on the final proofs of the first volume of a new monograph of Cucurbitaceae when he was suddenly seized with paralysis and died in his chair. Thus mercifully ended the career of a most lovable man and distinguished taxonomist.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Garrya elliptica.—The mention of Garrya elliptica on p. 101 recalls to my memory an interesting little discovery made by the late Dr. Hogg. He brought to the Scientific Committee of the Royal Horticultural Society, when I was secretary, a cutting of Garrya grafted on Aucuba japonica. He said he had tried a number of stocks for experiment, and this was the only one which succeeded. He was not aware of the fact that Bentham and Hooker in *The Genera Plantarum* place Garrya as the genus immediately following Aucuba, showing their close affinity. This may be a useful hint to cultivators who raise the former. *George Henslow, Bournemouth.*

Insects and Fungi on Grass Land.—When grass land is first broken up for the cultivation of vegetables, or anything else, one expects to be troubled with many insects, particularly wireworms. On a three-acre piece of land coming under my observation last year I did not see a single wireworm nor heard of one being found. The insects native to the place were the Summer Chafer (Rhizotrogus solstitialis), Cock Chafer (Melolontha vulgaris), Leather Jackets (Tipula), and the Surface Caterpillars (Agrotis exclamationis and A. segetum). The two last were the most destructive to Cabbages, Parsley and Potatos. Some other insects were present, but they disappeared with the destruction of their food or shelter, and were not injurious to the vegetables. All the undermentioned were imported, or colonised the new feeding ground. The Cabbage Fly (Anthomyia Brassicæ) was imported on seedling Cabbages. Congeners of this were A. betæ, on Beet: A. ceparum, on Onions: and A. radiæum, on Radishes. Other garden insects were the Celery Fly (Acidia heraclei) on Parsnips, and there was a very bad attack last year owing to the dry weather; the Carrot Fly (Psila rosæ) and the Cabbage Gall Weevil (Ceutorhynchus sulcicollis). The Vapourer Moth (Orgyia antiqua) is a garden pest, but seemed to confine its attentions to Plane trees. The Black Aphis (A. rumicis) on Broad Beans: and the mealy Cabbage Aphis (A. Brassicæ) were more or less destructive. One of the flat-body moths (Depressaria pastinacella) ruined Parsnip leaves more quickly than the Celery Fly, but happily was not numerous. Of all the above, most damage was done by the Surface Caterpillars. Of the fungi, Sclerotinia bulborum did a little damage to Onions; and Cystopus candidus, which usually destroys Shepherd's Purse, was prevalent on Cabbage seedlings, but the latter grew out of it. *J. F.*

Fig. 44.—Woodhouse Farm, on the Enham Estate (see p. 112).

Frost and Thaw.—A great many questions are raised by *A. N.* (p. 88), some of which are not easy to answer. Some of them, however, come within the scope of my experience. It is common knowledge amongst gardeners that if snow or frozen lumps of soil are buried in the operations of trenching and digging they take longer to thaw than if left on the surface, and keep the lower strata of the soil cold and wet for a long period. If it were possible to drain the soil in question, the water would sink to a much lower level, thus leaving air passages through which the warmer air would follow and raise the temperature of the land. This may be seen even in farming operations, where the corn ripens earlier than it did previously as a result of the draining of the land. The summer mulch prevents the escape of moisture from the soil by evaporation. This may take the form of manure, half-decayed leaves, road sweepings, and more or less decayed vegetable matter generally. A surface of 1 to 2 inches of dry dust makes a very good mulch. I had good evidence of this last year on shallow sandy soil overlying gravel. The drought continued from late April to the second week of July. Frequently-hoed Potatos retained a healthy, dark green appearance until after they were earthed up. The whole of the soil then quickly dried out to the bottom, and the ridges did not become permeated with moisture till near the end of September. I cannot agree with the statement that the winter mulch would keep the soil drier. It soon gets saturated, and the excess runs through. No good rosarian would mulch his Roses in winter. Soluble plant food in the soil gets reached by the rains, but if the subsoil is waterlogged the nitrates and salts are lost by diffusion where the roots of plants cannot follow. *J.*

Women in Horticulture (see p. 77).—In reference to the remarks of *Dubious*, I agree that women cannot altogether take the place of men in the general routine of large gardens. A woman can never become a labouring gardener; but, given a really adequate training, I see no reason why she should not do well in most branches. I attribute the failure of so many educated women gardeners in war-time to the following reasons:—(1) They have been over eager to obtain a war job; (2) they have often had only a few months'—or at the outside, a year's—training, and that may have been at one of the horticultural colleges where the training leaves much to be desired.

The male gardener has usually devoted his whole life to the garden; and how is it possible for a woman, educated or not, to be a success and assimilate the knowledge and experience in such a short period? I believe that there is a chance for the educated woman, if she is prepared to devote not a few months but a few years to the study of horticulture, instead of rushing headlong and in ignorance into some post. *Hopeful.*

Birds and Fruit-buds (see p. 237, Vol. LXIV.).—Like Mr. Hudson, I have no desire to get rid of sparrows, but do all I can to encourage them in the garden, as I consider them the best friends of the fruit grower, and that in consequence it is a great mistake to destroy young sparrows or the eggs of these birds. Caterpillars and other insect pests are most troublesome on fruit trees in the spring. The sparrow feeds its young almost entirely on these pests, if it can get them. Every season I have watched the birds searching the trees and carrying the grubs to their young. I have not found the sparrow to touch any kind of fruit or fruit-buds, except in a garden near London, where they picked out the buds of Gooseberries and Currants in the spring. We sprayed the bushes with thin lime-wash, which completely stopped the birds from damaging the buds. The buds of Plums they never touched. When I came here, some 20 years ago, the men informed me that sparrows picked the buds from the bush fruits, Plums, Almonds, and some Pears. I asked them when they saw a sparrow picking buds or bloom to let me know. On one occasion they told me that sparrows were picking out Plum buds. I looked and saw that they had been disturbed, and had flown up from a patch of Chickweed, and were wiping their beaks on the twigs, a thing anyone can see them do when they fly up from the ground. I kept watch for the real culprits, and whenever I saw a bird actually picking out the buds I brought it down with a small rifle or collector's gun, and in every case found it to be a bullfinch. During the past four years we have not been troubled with bullfinches, and have not had a bud or bloom destroyed. I do not know if the severe winter killed the bullfinches or whether soldiers frightened them away, as we usually have a lot of these birds here, and they are very shy. Before that I was forced to spray every Gooseberry and Currant bush as soon as it was pruned, and as many Plum trees as possible. When the last were in bloom I put pieces of bright tin on the outside branches so that the tins could swing round, and also in front of the wall trees. Half a dozen bullfinches will do enormous damage in a garden. It is rather strange, but during the past three or four years sparrows have not attacked Crocuses, Polyanthuses, and young Peas. Tomtits, wrens, and tree climbers are useful birds for searching the stems and branches for mussel scale and the eggs of various insects. The robin, thrush, blackbird (when there is no fruit about), and hedge sparrow are all useful garden birds. Blackbirds and starlings are greedy birds for fruits of all kinds. I am not writing the above to contradict Mr. Chaffer's statement about the sparrow, but to ask gardeners and fruit growers to put prejudice on one side and honestly look for the sparrow's merits, as well as its faults. I may add that where the bullfinch is troublesome to bush fruit I find spraying with freshly slaked lime in the winter a good preventive. Old slaked lime will not adhere to the trees or bushes. *Wm. Stanbury, Mount Felix Gardens, Walton-on-Thames.*

——On p. 33 Mr. Chaffer wished to know how to deal effectually with sparrows. Evidently he is not aware of the wire sparrow-trap—roughly 18 inches square—which he could get (in pre-war days) at any of the big London general stores. As a bird lover I am not in favour of such measures having to be taken; but where sparrows are pests, and where there are too many of them, the wire trap method is the simplest and most humane.

method of reducing them. Place the trap on the ground where the birds frequent, having first put a little food on the site the trap occupies. The birds will go down to the food through a hole in the top, and cannot—or very rarely—get out. When several birds are trapped, immerse the trap in a tank of water. If it is wished to release any other bird, there is a door for so doing. *C. Turner.*

Gardeners' "Victory" Memorial (see p. 88).—There are many gardens throughout the country which have, we all regret to know, lost some members of the staff during the war. Some may have only lost one, others, alas! many, and the larger the staff oftentimes the greater the number of these heroes. A suggestion was made to me the other day which I thought such an admirable one that I should be very pleased if you would grant me the hospitality of your columns to place it on record, as it may prove of considerable interest to many of your readers. In most gardens of any considerable size there is generally vacant wall space, and it was suggested an inspiriting memorial would be provided if the names of fallen heroes who had worked in the particular garden could be inscribed thereon. A brass tablet, engraved marble slab, or even a simple, painted board would serve to keep their names and rank ever fresh before us. I should much like to learn the views of others as to whether this plan could not be carried out in gardens all over the country. *Edwin Beckett, Aldenham House Gardens.*

Now that the thoughts of horticulturists are turning again to peaceful occupations after the past years of anxiety and sorrow, various schemes are being suggested to perpetuate the memory of our fallen heroes. It is to be hoped that some scheme commensurate with the sacrifice and endurance of horticulturists in the great war may be established. In this connection one's thoughts naturally turn to the two charitable gardening institutions—the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund—at present both handicapped in their good work for want of funds. But, looking ahead, may we not hope that at no distant date the Government will extend the provisions of the Old Age Pension Act? If this comes about, presently there will be less need for benevolent institutions. On the contrary there is always a demand for suitable housing for old people displaced from their employment by age. If a National Horticultural Memorial could be established in the form of a garden city or settlement, where such old people could be accommodated at a nominal rent, a great boon would be conferred on them, without the taint of charity, and a memorial worthy of our heroes and horticulture would have been made. Obviously this means money, but with the aid of the millions of all classes who love gardens throughout the country, I am convinced it could be made a practical scheme. Will some landholder start by giving 100 acres? *N. F. B*

Union of Gardeners in the Bristol District.—Gardeners in and around Bristol have unanimously decided to form a branch of the National Union of General Workers. There are many gardeners in Bristol and the district who share their employer's confidence, and they are looked upon not as servants in the strict sense, but as friends, and nothing is too small or too great for them to undertake if it makes for their respected employers' interest, and it is our earnest desire that this happy state should continue. A gardener's calling forty years ago was considered a profession second to none among the working classes of this country; but to-day it holds out no attraction to lads and young men. I appeal to all employers (who have themselves joined some form of union or other to protect themselves in business) to look on this step as a dire necessity in the twentieth century, and ask them to urge their gardeners to become members. During four and a half years of war, gardeners fought hard battles and won them. The younger men grasped the implements of war, the older men took up the garden tools, which many had laid aside, and also imparted that superior knowledge they possess to their fellow-countrymen, to enable them to cultivate the land and make it produce its maximum amount of food; their efforts did much more towards winning the war for our country than the ordinary individual may care to admit. The meetings of the Union will be held on the first Tuesday in every month at Kingsley Hall, Old Market Street, and all gardeners are invited to be present. *Thos. P. Elkes.*

The Recent Severe Weather.—The following degrees of frost were recorded in these gardens from February 7 to February 13 inclusive: 24, 34, 25, 19, 15, 26, 17. I do not remember having registered 34° before, but there may have been that amount in 1895, of which year I have not a reliable record. *C. J. Ampthill Park Gardens, Bedfordshire.*

Fig. 45.—Double-flowered form of Primula malacoides.

Primula malacoides.—This Primula is a plant of general utility, as it is available for many different purposes. It made its first public appearance on November 24, 1908, when shown by Messrs. Bees, and an Award of Merit was given it by the Floral Committee of the Royal Horticultural Society on that date. Considering that, compared with P. sinensis and P. obconica, it is a comparatively new species, it bids fair in time to give rise to as many distinct forms as either of the others. The variety President, to which an Award of Merit was granted on January 28, as described in *The Gardeners' Chronicle* (p. 57), is a decided variation, while the older King Albert, which gained a similar honour a couple of years ago, is remarkable for its richly-coloured blossoms. Besides these the true species, with its pale lilac flowers, varies considerably in tint when raised from seed. By selection a pure white strain has been obtained. Flowers more or less of a double character have made their appearance (see fig. 45), the variety President above referred to being one of them. When one remembers the comparatively poor flowers of Primula obconica, as sent home by Maries, and known at first as P. poculiformis, the hopes held out for the development of P. malacoides are surely not too sanguine. P. obconica was given a First-class Certificate on March 28, 1882. In those days, however, the higher honours were more easily obtained. *W. T.*

Iris unguicularis (see p. 51).—A not inconsiderable experience enables me to fully endorse the conclusions arrived at by Mr. Dykes, that April is by far the best period of the year to break up and replant this Iris. With its flowering then practically at an end, evidences of new growth are soon apparent, and synchronising therewith is renewed root activity. Hence a primary advantage of April planting—and early April more particularly—is that new annual top growth and fresh root activity continue without check, to the benefit of the plant, in the position it is destined to occupy. For no other season of planting can so much be claimed. I say this without hesitation, having planted the species in May and June and with the experience of the behaviour of plants received from Holland, and elsewhere, so late in the season as October or November. Often enough these imported plants are useful object lessons. Recently divided as they usually are, and top growth curtailed to the

extent probably of one half its length, the plant suffers not a little, should severe weather ensue, if it is simply laid in by the heels in the soil without other protection. This being so, I have often resorted to planting in boxes, and the warmer soil conditions of weathered ashes, or ashes and coconut fibre mixed, placing the batch in frames if necessary. The bulk being required for orders it was in the execution of these and the residue therefrom that interesting hints were obtained. Generally it was found that in the warmer rooting mediums early root activity was promoted without loss of plants. Late imported Odonis, Helleborus (Christmas Roses) and others which suffer much during winter in the soil, may be preserved in the same way. As to soil, where it consists of a light loam, I have usually restricted the depth of the prepared bed to 18 inches or thereabouts, adding old mortar rubble or a little lime. In gardens where the soil is retentive and heavy I advocate a raised bed and specially prepared ground. This not infrequently necessitates discarding some of the original soil and substituting a few inches of ashes or brick rubble to insure a more complete drainage and prevent, so far as possible, the roots descending into the stronger soil below. While in no wise fastidious this Iris thoroughly appreciates a calcareous soil, and a mixture containing lime in some form is desirable. Other items of cultural importance include very firm planting arranging the rhizomes quite near the surface, and should dry conditions prevail at the time, a few soakings of water during the season of active growth. *E. H. Jenkins.*

THE APIARY.

By Chloris.

Hives.—The shortage of sugar has made many people anxious to keep bees, for honey can be utilised for nearly every purpose for which sugar is used, and is much more valuable as a food. Beginners need advice about the choice of a hive, and how to make one. The old-fashioned skep, though picturesque, is not adapted to the modern methods of bee-keeping, nor so profitable as frame hives. There are two kinds of wooden hives which claim the attention of all modern apiarists—one, the single-walled hive; the second, the "W.B.C." hive, which is named after the initials of a famous bee-keeper, William Broughton Carr. The great disadvantage of the single-walled hive is that there is a great tendency for water to penetrate it, and thus render the bees liable to dysentery. For this reason I strongly recommend the "W.B.C." hive to all bee-keepers; and, having settled on a type of hive, to keep to that selected, and have one set of measurements, so that all parts will be easily interchangeable.

Hive-making. Good, straight-grained, well-seasoned wood is essential to the making of a hive, and it should be about ½ inch to ⅝ inch thick. Wood, no matter how good, is very liable to rot, and to deteriorate through fungous attacks. Further, the interior is liable to become damp through condensation, which in itself promotes decay. Beginners, being desirous of checking decay, at once use some of the common rot-preventers; but these are generally highly injurious to bees, and therefore should not be utilised. To overcome the ill-effects of damp, some bee-keepers make a practice of scorching the interior walls with a blow-lamp; and this also makes the hives more sanitary.

All parts of a hive should be movable, so that it may be placed higher or lower, according to needs. In Fig. 46, **a** is a floor of 1 to 1¼ inch boards, fixed by joists to legs which extend beyond the joists 6 to 8 inches; **e** is the alighting-board, and slopes to the interior of the hive to the centre; **f** is the entrance, which must allow for a clear space of $\frac{3}{16}$ of an inch, at least, and not more than ¼ of an inch, and extends about 1 foot in length, for it must have a flat part of 2 to 3 inches at each end for the hive to rest on and to close the ends; **b** is the body-box, or brood-chamber, and is 9 inches deep. To cover the joint all round, plinths (**g**) are nailed on to the upper part, and these are usually ⅜ inch thick—bevelled on the top edge to throw off the rain—and 1½ to 1¾ inch deep. The porch (**h**) extends from end to end of the front, with both ends closed to throw the rain free of the entrance (**f**); **i** is a rabbeted slip of wood, to carry two strips of wood to open or contract the entrance; for in winter the entrance must be closed, to allow one bee only to pass at one time. As the weather becomes warmer, and the bees busier, the entrances should be opened gradually until at last they are the full width apart; **c c** are lifts, and are used to make room for the bees to store surplus honey. These are usually about 6 inches deep. The roof (**d**) slopes towards the back, to allow the water to run off, and extends 3 or 4 inches beyond the front and the back. To render the roof waterproof, it is essential to cover it with thin zinc or painted and well-stretched calico. The inner parts of the hive are lidless and bottomless boxes, and, as ten frames are usually placed in the brood-chamber, they need to be 16½ inches long, which leaves ample space for two ⅜ inch division boards being placed one at each end—to contract the interior space, if needed. The projecting portions (**j j**) are metal strips, to carry the ends of the frames, so that the bees cannot easily fix the frames by propolising.

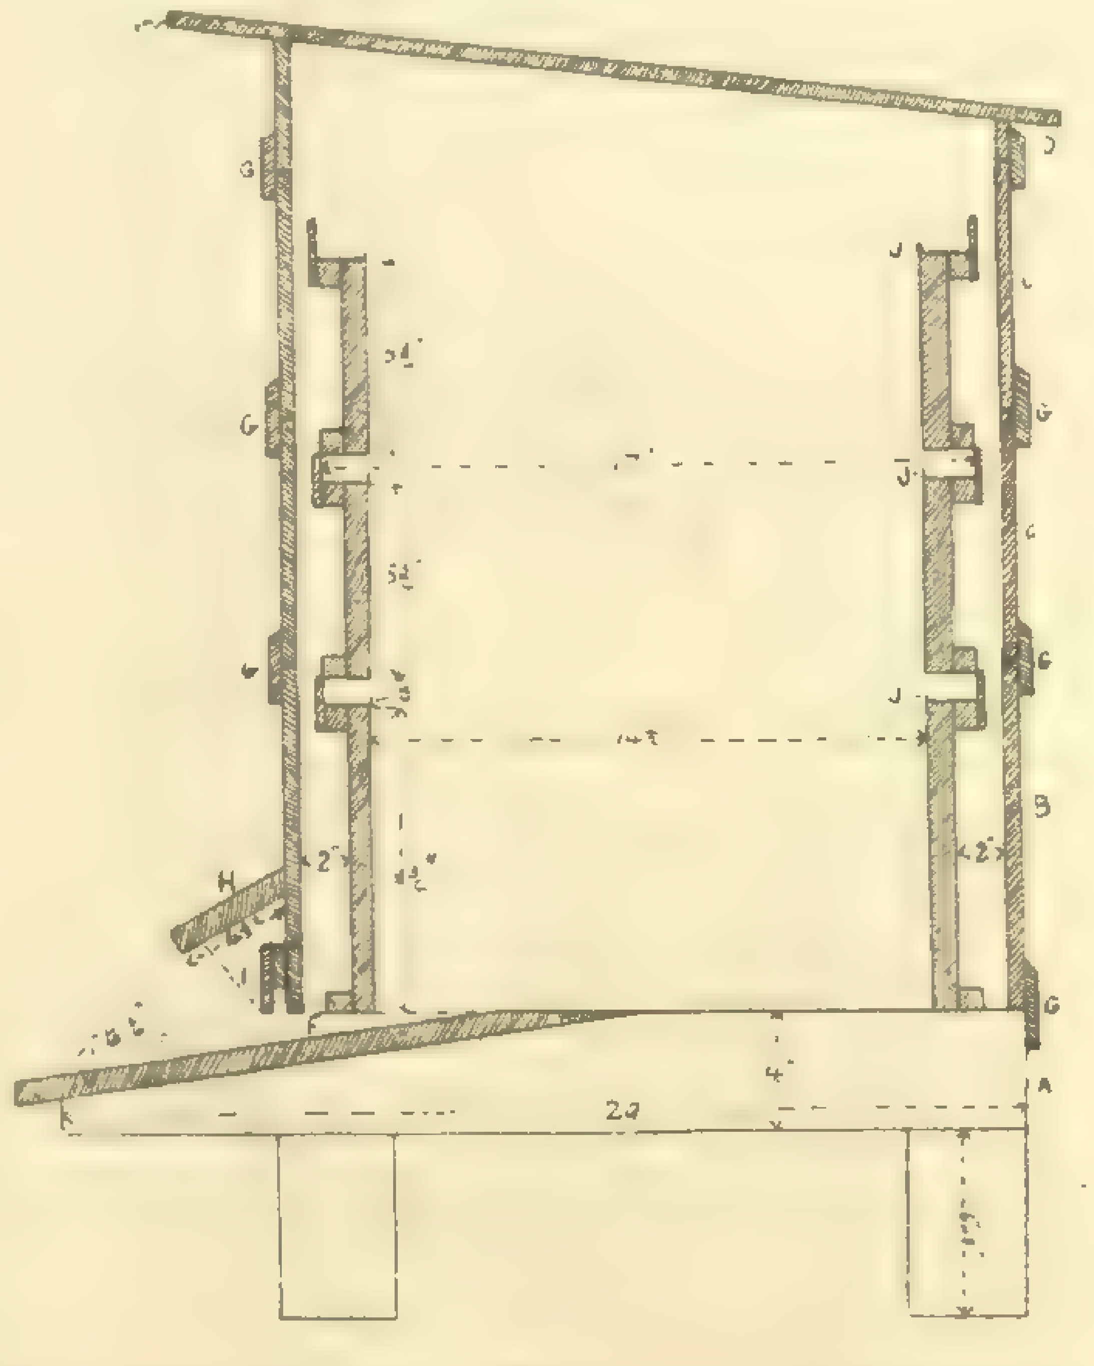

FIG. 46.—SECTION OF A "W.B.C." HIVE (see text).

SOCIETIES.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

FEBRUARY 6.—*Committee present:* The Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, D. A. Cowan, J. Cypher, J. Howes, A. Keeling, D. McLeod, E. Rogers, J. Benstead, and H. Arthur (secretary).

GROUPS.

A large Silver Gilt Medal was awarded to S. Gratrix, Esq., Whalley Range (gr. Mr. J. Howes), for a group of Cypripediums. Mrs. Bruce and Miss Wrigley, Bury (gr. Mr. E. Rogers), were awarded a Silver Gilt Medal for a group of Cypripediums and Odontoglossums. T. Worsley, Esq., Haslingden (gr. Mr. T. Wood), was awarded a Silver Medal for a group of Cypripediums.

The Hon. Robert James, Richmond (gr. Mr. Benstead); R. Ashworth, Esq., Newchurch (gr. Mr. Hough); Mr. W. Shackleton, and Mr. D. McLeod were also exhibitors.

Messrs. Cypher and Sons, Cheltenham, were awarded a Silver Medal for a group of Cypripediums and Dendrobiums.

AWARDS.

First-Class Certificates.

Lycaste Skinnerii vars. Rainbow and *The Gem*, from Mrs. Bruce and Miss Wrigley.

Cypripedium Queen of the Belgians var. majesticum, from S. Gratrix, Esq.

Awards of Merit.

Odontioda Hippolyta (Charlesworthii × ardentissimum), *Cypripedium Lord Wolmer var. Emperor*, *Odontoglossum crispum Louis Sander*, *Brasso-Cattleya Mary Gratrix*, and *Dendrobium Fairy Queen* (Rolfeæ × Wiganiæ), from S. Gratrix, Esq.

Odontoglossum Chas. Frenchum (amabile × Rolfeæ), from the Hon. Robert James.

Cypripedium Olympus var. Don Juan (Alcibiades × Leeanum Clinkaberryanum), from T. Worsley, Esq.

Award of Appreciation (1st Class).

Odontioda Earl Kitchener (Bradshawiæ × Rolfeæ), from S. Gratrix, Esq.

FEBRUARY 10.—*Committee present:* Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, D. A. Cowan, J. C. Cowan, J. Cypher, J. Evans, J. Howes, A. Keeling, J. Lupton, D. McLeod, W. Shackleton, and H. Arthur (secretary).

Groups.

S. Gratrix, Esq., Whalley Range (gr. Mr. Howes), was awarded a Silver Gilt Medal for a group of Cypripediums in variety. P. Smith, Esq., Ashton-on-Mersey (gr. Mr. E. W. Thompson), staged Odontoglossum crispum Fowmum Silver Medal. Dr. Craven Moore, Victoria Park Manchester (gr. Mr. T. Arran); Col Sir J. Rutherford, Bart., M.P., Blackburn (gr Mr. J. Lupton); Mr. D. McLeod, Chorlton; and Mr. W. Shackleton, Bradford, all staged a few Orchids.

AWARDS.

First-Class Certificates.

Odontoglossum crispum Fowmum (Fowlerianum × Mundayanum), *Laelio-Cattleya Eunice alba Haddon House var.* (L. anceps alba × Catt. chocoensis), from P. Smith, Esq.

Cattleya Trianæ Samuel Gratrix, from S. Gratrix, Esq.

Odontoglossum eximium Alpha, a heavily blotched variety, from Dr. Craven Moore.

Awards of Merit.

Dendrobium Mrs. T. B. Haywood; *D. Melpomeme magnifica*; *Odontoglossum Rossimium* (Rossi rubescens × eximium), and *Harvingtonii excellens*; *Cypripedium Conference var. Imperator*, from S. Gratrix, Esq.

Odontoglossum Luptonii (Edwardii × ardentissimum) from Col. Sir John Rutherford, Bart., M.P.

Cultural Certificate.

To Mr. J. Howes, for Dendrobium Mrs. T. B. Haywood, D. Melpomene magnificum, and Cattleya Trianæ Samuel Gratrix.

CROPS AND STOCK ON THE HOME FARM.

The Replanting of Woods.

The huge quantities of timber cut on many estates will provide ample opportunity for planting, which should be taken in hand at once. The question that will be uppermost in the mind of those with little experience will be what is the best kind of tree to plant for a quick return and for future generations. Where Larch succeeds, as it usually does, in a deep loam or in sandy soils, this is no doubt one of the best trees to plant; either large or small, the timber is always in demand, and especially for estate work. In heavy loams overlying a stiff subsoil of clay, even though chalk abounds lower down, Larch canker will affect the trees when they are fifteen years old; that is my experience. If the trees pass that stage free from disease they usually remain healthy, and although they do not make extra rapid growth afterwards, the wood is of good quality. If the stiff subsoil of such land which is naturally detrimental to the growth of the Larch, could be broken up by trenching or steam cultivation to admit of a free passage of water from heavy rains, I am of the opinion that the trees would not have canker. This I have proved on a small way by trenching the soil forty years ago for clumps of trees including Larch. Not one

Larch in such clumps was affected, although close by in similar soil hundreds of trees were attacked.

I have great confidence in Corsica Pine for giving a quick return and growing freely in all kinds of soil. The growth is free, clean and, for inside work, the timber is excellent from trees twenty-five or thirty years planted. Another point in favour of Corsican Pine is that rabbits do not eat the trees to the same extent that they do other kinds of Fir. Spruce to supply timber for home use is valuable, the trees growing fairly fast in any soil.

Scots Fir is also desirable, and where it flourishes should be widely planted, as the timber is very useful.

Austrian Pine is quite second rate as a timber tree; it has a nasty "kink" at the base for quite a yard up the stem which quite spoils the timber. Growth, too, is slow. As a wind screen for any site or purpose this Pine is unrivalled.

A short time ago a writer recommended Douglas Fir for chalk; my experience is that it will not exist in chalk, let alone flourish.

Thuja Lobbii was named as a desirable tree to plant. Thirty years ago I planted in one block 2,000 trees in stiff soil. From the commencement they grew faster than the alternate Larch planted among them, and the Larch is now 40 feet high with butts quite 15 inches in diameter, very straight stems. I have but faint hope of their value as timber trees under eighty years growth; the wood is too soft to be of value, and age is required to develop the heart of the tree, as the outer portion contains so much sap.

Some writers on forestry advise a mixture of hardwood and Firs; I think such advice is wrong, one tree interfering too much with the growth of another. My plan is to plant in "blocks" of one sort, whereby the trees are drawn up straight with a minimum of knots. Hedgerow trees should convince anyone that timber trees do not require space for the growth of side branches. The same principle of block planting applies to hardwood trees, such as Ash, Beech, Chestnut, and Oak. No doubt where Ash succeeds it is the most profitable wood to plant but it rquires a deep loam soil to ensure a quick return. One of the greatest mistakes made in planting forest trees is that of planting specimens, especially if they have not been regularly transplanted. In the case of Conifers, including Larch, the trees should not be more than 18 inches high. With trees of this size or less there are fewer failures than when larger specimens are planted. *E. Molyneux, Swanmore Farm, Bishop's Waltham.*

Obituary.

F. Ducane Godman.—The late Mr. Frederick Ducane Godman, D.C.L., F.R.S., whose death occurred on Wednesday, the 19th ult., was a keen horticulturist, and at his country house near Horsham he had one of the most beautiful gardens in Sussex, where he had fine collections of Rhododendrons, alpine plants, and Orchids. Mr. Godman, who was in his eighty-fourth year, was the third son of Joseph Godman, of Park Hatch, Godalming. Although his early education at Eton and Cambridge gave him no special scientific advantages, he was born with a love for natural history. He had travelled widely, and was a great sportsman in the best sense of the word. As a zoologist, Mr. Godman was best known as the joint author and publisher of a most important series of natural history books. As an undergraduate at Cambridge he became intimate with the late Osbert Salvin, F.R.S., and the two men worked together in producing a great work on the natural history of Central America, which was begun in 1879 and completed only in 1915, some years after Salvin's death. Mr. Godman was also the author of a work on the natural history of the Azores, published in 1870. He was an indefatigable collector of birds and butterflies, and a most generous supporter of the British Museum of Natural History, to which the whole of his collections, amounting to many hundreds of thousands of specimens, were presented several years ago.

James Legg.—Mr. Jas. Legg, who died on February 27, in his 68th year, at Walton Hall Gardens, Warwick, was known as one of the most able gardeners in the Midlands. His ready wit and jovial disposition obtained for him a large circle of friends, who will greatly miss his genial presence. Mr. Legg had charge of the gardens at Walton Hall for forty years, and leaves a wife, one son, and a daughter. The son, who followed his father's calling, is now gardener at Warter Priory, Yorkshire.

TRADE NOTES.

LABOUR PROBLEMS.

The difficulties which have arisen owing to the position in which both employers and employed have been placed by changes of conditions due to the War could scarcely be expected to leave the Horticultural Trade untouched, and they undoubtedly call for sympathetic consideration on both sides. Fortunately, the hot-headedness and ignorance of the immutable laws of economics, which are endangering the future of certain other trades, are not likely to affect the calmness and soundness of judgment which experience has shown may be expected from those whose avocations on the land bring them into daily touch with the laws of nature, whether their position be that of employer or employed. One of the best features of horticulture has always been the feeling of mutual

Fig. 47.—The late Mr. James Legg.

understanding and respect which has existed in the trade, and it is pleasant to note the sympathy with which nurserymen, at all events, are looking into the problems with which their workpeople are faced, especially in view of the increased cost of living.

The problem mainly resolves itself into the question of wages and hours of labour, and the best solution is not one which can be arrived at off-hand. From the employers' point of view, it has to be recognised that the enjoyment of a garden is in the nature of a luxury which in these days many of the public are prepared to forego rather than give up other luxuries such as expensive motor cars or travelling abroad. If, therefore, the nurserymen increase the price of horticultural produce beyond a certain point customers will merely cut down the outlay which they have hitherto expended on their gardens, with the result that the nurserymen will have to put up with loss of business: this of course carries with it the inevitable reduction in his capacity to offer employment. The usual laws of demand and supply necessarily therefore fix a limit beyond which it is impossible for a nurseryman to charge his customers, even if his cost of production should rise so high as to leave no profit as an incentive to him to remain in the business.

On the contrary it is equally obvious that gardeners cannot at present do a fair day's work and maintain their families at the wages which were customary before the year 1914. If a manual worker is to do good work he must at least have the incentive of feeling that in return for his labour he is able to keep his head above water financially. It is clear, therefore that there must be an increase in wages, so long as the increased cost of living remains as a factor to be faced, and it is fair to admit that the majority of employers already acknowledge this necessity.

The question of the form in which any increase in wages should be made is itself by no means an easy one to decide, as it is clear that owing to the peculiar condition of the Horticultural Trade manual workers cannot put in so many hours of labour during the dark winter months as they are able to do during the summer. There are at least two methods of arranging the increase in wages, viz: (1) To spread the annual increase equally over the whole year by paying a larger weekly wage, irrespective of the number of hours worked either in winter or summer, or (2) to allocate the increase according to the number of hours of work put in, which would mean more wages earned in the summer than in the winter.

The difficulty which arises in connection with the latter method is that during the winter the manual worker is still faced with the problem of having to expend a minimum weekly sum in order to maintain his family, and the fact that he is precluded by darkness from working as long in winter as he can do in summer is, of course, a matter which cannot be expected to interest either his butcher or his baker! It has to be recognised therefore that, even during that season of the year when shorter hours of labour obtain, there must be a minimum weekly wage below which the employee cannot live. On the other hand if the employer spreads over the entire year the increase in wages (for which he can only look to be compensated for the additional work put in during the longer days of the summer months) there is always the danger that the less thoughtful among the workers may expect to "have the matter both ways," that is to say, forgetting the extra benefits which they received during the winter months in anticipation of their summer labour, they might still expect to receive full payment for the extra hours of work put in during the summer, with the result that the employer would to some extent be paying twice over.

On the whole, the best method would appear to be that of adopting a fixed minimum wage throughout the year, based on the cost of living as it may vary from time to time, together with some additional remuneration to be paid in respect of the longer hours to be worked during the summer months. This, however, still leaves open the question of what is to be regarded as a standard day's work. It is obvious that those who work on the land are not subjected to the same unhealthy conditions or to the strain of close concentration on minute mechanical implements which represent the normal life of the worker in town factories. A comparison, therefore, of the hours of labour put in by the horticulturist with those of the factory worker would be unpracticable and misleading. On the whole it would seem that a fair standard of the minimum number of hours work to be put in by the manual worker in horticulture would be 48 hours weekly, together with an average of an additional six hours per week during the summer months. This extra six hours might perhaps be paid for at a somewhat higher rate, such as, for instance, time and a quarter.

The proposal which has been made in certain quarters that there should be a fixed minimum wage for manual workers engaged in "intensive" cultivation and a lower fixed minimum wage for those engaged in "extensive" cultivation is not so easy of application as might appear at first sight. If land devoted to the former method were set apart, with a special gang of workers, quite distinct from land devoted to the latter purpose, no difficulty would arise, but in practice it is obvious that the two methods of cultivation are in many instances hopelessly intermixed. The manual worker in horticulture may, for instance, be employed for an hour or two on work which might be described as "intensive cultivation," and immediately afterwards he may be employed for two or three hours on work which could

only be described as "extensive cultivation." For these reasons, it would seem impossible to draw a dividing line between the two, and it must of course be borne in mind that the proposal only applies to a *minimum* wage. In practice, the man who has the skill and knowledge necessary for intensive cultivation already receives a higher wage than a man employed on extensive cultivation. It is obvious that the latter cannot be expected to be paid as highly as the former, and the skilled operator would have just cause for complaint if he were dragged down to the level of the unskilled worker. The more practical course would appear to be to fix a minimum rate of remuneration for the unskilled worker, while leaving the skilled worker to arrange with his employer for the extra wage which his additional knowledge and earning capacity would enable the employer to pay. *D.M.*

The new "Ministry of Ways and Communications Bill" is likely to meet with considerable criticism from the Commercial Members of the House of Commons. If the Bill goes through in its present form, the Minister will have the powers of a Dictator in connection with all matters of transport, his jurisdiction extending over railways, ports, canals and roads, in addition to electric power supply. It has often been remarked that trade is the life-blood of a country, and it is no exaggeration to say that our railways, roads and canals are the arteries through which this life-blood flows. It is possible to cause congestion in these arteries, not only by providing an inefficient service, but also by charging rates for the carriage of merchandise in excess of what a Trade is able to bear.

In these circumstances, traders will view with grave apprehension the provisions in the Bill to the effect that the Minister in charge of this Government department is to have power to order the railway companies to charge any rates that he may think fit for the carriage of goods. Hitherto the power to raise rates has at least been limited to the maximum amounts permitted by the Railway Charges Orders, and any unreasonable raising of rates could be challenged before the Railway and Canal Commissioners. The new Bill provides, however, that any rates which are increased by order of the Minister of Ways and Communications shall be deemed reasonable, even though they may be beyond the maxima fixed by the existing Railway Charges Orders. Unless the Bill is drastically amended, therefore, it would seem that in future the rates for transport of goods will be practically unlimited according to the discretion of the Minister, who in his turn will doubtless be advised on matters of detail by his subordinate officials.

The Minister now nominated for the post will doubtless endeavour to hold the balance fairly between the railway companies and the public, but his task will be a difficult one, as, by reason of his training and past experience, it seems inevitable that he should be saturated with the railway point of view, and it is not unnatural to anticipate that many of his subordinate officials will have had similar training. It is to be hoped that the Chamber of Horticulture may give early attention to the position of the Horticultural and allied trades under the new conditions; the Chamber certainly seems to have made its appearance at the moment when united action by the Trade, both for defence and constructive reform, has become more urgent than ever. *M.*

The Offices of the Chamber of Horticulture will be removed as from Monday, March 10, to 11, Adam Street, Strand, W.C. This address is only temporary, pending the selection by the Organising Committee of a building in which the Chamber may be permanently located, and in regard to which building the Organising Committee is now in negotiation. It is hoped however, that until permanent arrangements are effected, the Organising Committee may be able to render to each and every Member of the Chamber such assistance and benefits as were comprehended in the privileges of membership originally offered.

Mr. John Coombes, late organiser of spraying under the Food Production Department in the counties of Gloucester, Hereford and Worcester, has been appointed representative of the Mond Nickel Company, Ltd., in the Western counties, in connection with the firm's activities in spraying.

The Spalding and District Bulb Growers' and Market Gardeners' Association have passed a resolution asking the Government to retain the embargo upon the importation of bulbs until a year after peace is signed.

LAW NOTES.

Failure of a Market Gardener.

At the offices of the Official Receiver for the Edmonton District, Bedford Row, W.C., on Tuesday, the 25th ult., the first meeting of creditors was held under the failure *re* Alfred John Burton (Senr.), of Bush Hill Park Farm, Bury Street, Lower Edmonton, farmer and market gardener.

The statement of affairs filed by the debtor showed gross liabilities amounting to £4,000 17s. 5d., of which £1,831 7s. 5d. was due to unsecured creditors: to fully secured creditors. £2,142 2s.; the value of the securities being also returned at £2,142 2s. The total liabilities expected to rank against the estate for dividend were returned at £1,848 15s. 5d. The assets were valued at £20, from which £10 had to be deducted for the claims of preferential creditors payable in full: leaving net assets at £10, and disclosing a deficiency of £1,838 15s. 5d. The unsecured liabilities include £805 due to moneylender, £500 for private loans, £287 10s. 6d. for judgment and costs in a law action, £39 1s. 11d. for other law costs, the balance being for goods supplied or work done. The fully secured creditors are the freeholder of the farmhouse, the bill of sale holder, and the bank—which holds a charge on a life policy for £500. There are practically no assets. Mr. Frederick Seymour Salaman was appointed trustee.

ANSWERS TO CORRESPONDENTS.

Caterpillars Eggs on Plum Tree: *Ajax.* Probably the caterpillars which cause the leaves to curl are those of the Winter Moth or allied species, though we cannot say for certain without seeing them. Spraying with arsenate of lead would kill them by poisoning the leaves on which they feed. Spray as soon as you see any of the pests. If you grease-band the tree in October, and smear a band of grease along the wall level with that on the tree, you would catch many of the wingless female moths and largely prevent egg laying and caterpillar infestation another year.

Head Gardener's Notice. —*D. J.*: Your employer is not entitled to alter the terms of your engagement without giving you one month's previous notice, or a month's wages instead of notice. This applies both to the alteration in your position and to the stoppage of pay for Sunday duty. Consult the solicitor who does most work in your local county court.

Names of Fruits: *M. E. L.* Newton Wonder Apple: the spots on the fruits are caused by a fungus known as "Bitter Pit" and a damp fruit room would favour the development of the disease. —*T. L. I.* The pale green Apple is Lemon Pippin; the striped one was decayed.

Names of Plants.—*C. C.*: Eranthis hyemalis *A. H. K.*: Daphne odora variegata and Prunus japonica roseoflore pleno.—*B.*: Chlorophytum elatum. *T. W. W.* Billbergia nutans. *D. S.* 1. Pandanus Veitchii: 2. Codiaeum Reidii: 3. C. varigatum: 4. Eupatorium Weinmannianum: 5. Codiaeum illustris.

Old Chrysanthemum Stools: *C. C.* The plants which were grown under glass in autumn may be used for planting in the open this year provided they are not exhausted. If kept in a cold frame, they should have begun to grow by this time, consequently it would be an easy matter to divide the stools and plant the separate portions early in April.

Peach Trees: *M. P.* It is not necessary to remove the Peach trees from the wires on which they have been trained, but for the sake of cleanliness, and to make sure that no ties are cutting the stems, it is a good plan to remove all the branches and retrain them after the wires and all parts of the Peach house have been thoroughly cleansed.

Pear Tree Cankered: *J. P.* The Pear tree growths submitted show evidence of a rather severe attack of canker (Nectria ditissima), a fungous disease which is all too common in Apple and Pear trees. Specimens which are badly diseased should be grubbed out and burned. In the case of a less virulent attack the cankered branches should be cut away, and in some instances it may be possible to save a branch by cutting away the diseased portion, smoothing the cut surface with a sharp knife or spoke-shave, and immediately dressing it with tar.

Seed Potatos with Rough Skins: *H. G.* There is no evidence of fungous disease or of damage by insect pests in the sample of seed Potatos sent. The roughening of the skins is due to some irritant matter in the soil in which the Potatos were grown, and as it is of a very superficial character they are quite suitable for seed purposes.

Seeding Cinerarias and Primulas: *E. G.* To secure a good crop of seeds of Cinerarias and of Primula malacoides the plants should be kept in a light and airy greenhouse. They should have sufficient moisture at the roots, but must not be over watered, and the atmosphere of the house should be kept quite dry.

Small Cyclamen: *C. C.* The small plants should be kept in a warm greenhouse near the roof glass for several weeks longer. They may then be transferred to a pit or frame where they may be kept close for a week or so and then receive fresh air according to the weather conditions prevailing. The plants should be potted as necessary and syringed over-head twice daily in suitable weather.

Treatment of Arum Lilies: *W. L. A.* From the description you give of your Richardias (Arum Lilies) we suspect that they have either been injured by frost or aphis. A minimum temperature of 50° is suitable, with sufficient air to prevent the plants making weakly growth. Examine the roots and, if these are active, give them weak doses of liquid manure. It is too late to repot the plants this season. A good practice is to plant them out in May; the only attention required in summer is to give them plenty of water. Lift the plants in September with plenty of soil, and pot them in a mixture of four parts loam, and one of leaf-mould and short dung. The next few weeks is a good time to pot Asparagus Ferns.

Violets: *J. M. S.* If the runners are pegged to the soil early in April they will root and be ready for planting out in May, 12 to 15 inches apart, in a border previously prepared for them. To propagate Violets from cuttings select stout shoots, 3 or 4 inches in length, from short-jointed runners during the autumn, and dibble the cuttings in light sandy soil in a frame facing south, as near the glass as possible. As soon as the cuttings are rooted give them cool treatment to prevent damping. They should be planted in the open in April, selecting stiff, stocky plants for the purpose, giving them the usual summer treatment afterwards. Much depends on propagating from healthy stock, but as a general rule, the healthiest plants are raised from cuttings and runners, rather than from division of the old plants. The greatest success is obtained when these plants are treated as hardily as possible: they will not thrive for long in stiff, heavy soils.

MARKETS.

COVENT GARDEN, March 5.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Eds.

Remarks.—The supplies of cut blooms are not sufficient for the demand, even at the present high prices. White flowers are still in great request and Salesmen find it impossible to supply their customers' full requirements. A good supply of flowers from Guernsey and Scilly arrived to-day, consisting chiefly of **Narcissus Grand Primo** (white), **Narcissus Sol d'Or**, double and single **Daffodils**, small quantities of **Freesia**, **Richardias** (Arum Lilies), **Violets** and **Allium** (Star of Bethlehems). All white flowers are selling freely, but the supplies are very irregular. French flowers are arriving in a very unsatisfactory condition. Paper White Narcissus is almost over for the season, and there are very few Stocks or Star of Bethlehem, which is the usual substitute for Stocks White Lilac is arriving from Holland in excellent condition,. also small consignments of White and Coloured Tulips. Amongst the Home Grown flowers Darwin Tulips in various shades are very prominent just now, and are realising good prices. Daffodils are also arriving in excellent condition: the finest varieties are Emperor, Victoria, Sir Watkin, J. M. Berkley, Princeps and Golden Spur. Good spikes of Ornatus are arriving in limited quantities only. Red Roses are gradually increasing in quantity, including a few excellent blooms of Ophelia, Sunburst, and a few choice white blooms offered by Mr. Beckwith at prices ranging from 18s. to 24s. per dozen blooms.

Remarks.—The English Grape crop is finishing, but supplies of **Belgian Grapes** have shown an increase, including Muscats. Californian Pears arriving in larger quantities consist of the Winter Nelis and Easter Beurré. Strawberries (forced) are now offered. The Oranges now available are Denias, Valencias, and Californian Seedless and Tangerines. Forced Vegetables still continue a limited supply. Of Teneriffe Tomatos a consignment is due this week of 6000 to 7000 Bundles, each consisting of four boxes containing 12 lbs. to 14 lbs. weight. Outdoor Vegetables are scarce.

POTATO DISEASE.

When the History of the 20th Century Horticulture comes to be written, whoever takes the task in hand will simply have to give prominence to the great part played by Ryder and Son, Ltd., St. Albans, the Pioneers of really good seeds in small cheap packets, the caterers for the Horticultural million, and the firm who daily execute thousands of orders.

We will for the moment leave all this to the Historian, but we have a word to say about Ryder's great plan by which, with *your help*, the Potato Crops of Great Britain can be saved from destruction by disease.

It is only by raising new varieties from seed that you can stamp out disease, but the seed must be Pedigree bred, scientifically hybridised. That's where the private gardener and amateur are at a loss, but Ryder's have acquired the total output of one of the World's Greatest Potato Breeders, and offer you seed of his production at 6d. per packet.

The growing of the seed will give you pleasure, it may likely enough bring you fame, as introducer of a disease resisting Potato, and it may make you a winner of one of Ryder's splendid Cash Prizes. The Catalogue will tell you all about this matter. It also tells about Ryder's Great Exhibition Prize Scheme.

Abolish Disease by growing healthy Seed Potatoes from RYDER'S Hybridised Potato Seeds, 6d. per packet.	Avoid Onion Fly and obtain early onions by planting ONION SETS (Ailsa Crag Type) 2 9 per packet.

CATALOGUE FREE.

Send postcard to-day for a copy of the 1919 Catalogue, which contains full particulars of Ryder's Great Vegetable Competition.

RYDER & SON, LTD.,
Seed Specialists, ST. ALBANS.

FLOWERS OF THE DESERT.

DESERTS are of many kinds and of all degrees of desertion, from those entirely devoid of life, such as in Central Arabia, to those which, like the Mesopotamian desert, support at certain seasons a considerable if modest vegetation, hence flocks, and, ultimately, men. The popular idea of a desert in the English parochial mind is very naturally a sahara of sand (sahara, by the way, is the Turkish word for desert), a waterless, lifeless, burning waste of dunes; for all the most famous deserts, such as are familiar to us in our school geography books, do fulfil these conditions more or less completely. I need only mention those of North Africa, Central Asia, and the interior of Arabia and Australia.

But sand, though typical of, is by no means essential to, desert conditions, nor must it be forgotten that extreme cold is just as natural to deserts as is extreme heat, and for the same reason. Thus much of Central Tibet is a desert, a rocky desert, and by this time most people are aware that Mesopotamia is a desert—a mud desert in the south (Iraq) and a gravel desert in the north, where lies the ancient Chaldea.

Of the great civilisations and famous cities which once flourished in Mesopotamia, the Bible gives a sufficiently tantalising account, and most people are aware that in the long wars between the rival races inhabiting Western Asia, and again between those races and the rising civilisations of Eastern Europe, this once fertile country was gradually reduced to a desert, partly owing to fundamental changes in the course of the Tigris, and partly owing to the fact that there was neither the population nor the personal security necessary for the upkeep of the canals. This last process must indeed have worked automatically, for with the destruction or disuse of a canal, many people would have either starved or gone elsewhere, thus further reducing the population. At any rate, the country was once supremely fertile, full of great cities, and crossed by a gridiron of canals, some of which, still standing, are immense works. That the land is fertile still the beautiful gardens of Baghdad and Basrah amply testify, as does even the desert in spring, when, for a brief month or six weeks, rain and dew, and an absence of intolerable heat, enable an ephemeral vegetation to hurry through its brief existence, before the desiccating summer cuts it short.

The capabilities of the soil, under the glow of the Mesopotamian sun, must be seen to be believed. It is almost incredible, therefore I shall confine myself here to talking of the deserts as they are to-day. It must have been these same deserts in spring which gave to the first pastoral inhabitants an inkling of what might be achieved with crops if they settled down to agriculture; that, and the green fringe along the river banks, which whispered to them that they had only to plant and water, and the soil would straightway bring forth three and four crops a year.

My first view of the desert was at Basrah. Memories of a cold winter day come back to me; the sun setting in a sullen blaze beyond the lip of a bare, grey, saucer-shaped plain, the last Date Palms staggering out from the rich grove to die in the bitter emptiness, their dog eared, stunted leaves flapping in a cold wind which lifted up the white dust in spiteful little eddies; and the silence, the sense of loneliness under the cold starlight. How bright and home-like the camp seemed in comparison!

This grey-white, silt desert, glittering with salt, flooded every spring when the river rises, is a type. It includes the very considerable deltaic area from Basrah to the sea, which is flooded annually, and vast areas up river, at least as far north as Baghdad, which are liable to be flooded. Up country, however, the amount of salt in the soil is naturally less. In the real delta region, from Qurnah to the sea, a distance of roughly one hundred miles, the soil is so salt that scarcely anything will grow there, and the desert, even in spring, is not "shot" with green as we find it further north. Cultivation is confined to a belt along either bank of the river, carried in the Basrah district some three miles inland by means of broad, tidal creeks, and the desert is just a blazing white-hot furnace of dust in summer, and a slate-grey slough of mud in winter. A few scattered plants grow here and there — Samphire, Camel-thorn (a gorse-like plant, with crimson, Pea-flowers) and a grass, but broadly speaking this type of desert is devoid of plant life. The Babylonian plain on the contrary, from Babylon, S.W. of Baghdad, to Samara in the North, including Baghdad and the Diala river, differs in that the alluvial soil is not excessively salt. It is a mud plain, just the same, absolutely treeless, without even a bush rising so much as 2 feet above the ground level, white with drifting dust or grey with mud, to some extent cultivated, where here and there a group of crumbling mud walls and the bleaching skeletons of dead animals mark the site of a wretched village. But in spring it is green with grass and sparkling with flowers.

Another type of Mesopotamian desert is the gravel desert of the plateaux. West of the Euphrates the edges of the plateaux are soon reached, but one has to travel many hundred miles up the Tigris valley before gravel terraces, with conglomerate cliffs enclosing the river, are met with, as at Samara. Some nine miles west of Basrah is a gravel ridge, perhaps 20 feet high. Ascending this one finds oneself on the fringe of the plateau which forms the western boundary of the Euphrates, and extends away into the vastness of the Syrian desert. It is not flooded in spring, being above the highest flood level, and the gravel being well drained is consequently not salt. This gravel desert, or escarpment, overlooking the Euphrates valley, is, even more brilliant with dwarf flowers than the grassland, mud desert, in spring.

It was with considerable astonishment that I passed from the salt mud of the Basrah desert, with its scanty patches of "Camel-thorn," its clumps of Samphire, and its wide barren spaces, up some 20 feet of gravel and sand on to the undulating plateau, which was covered with bright flowers—blue Iris, white Salvia, thorny Caragana, brilliant blue Pimpernel, Asphodel, Geranium, (several species), and many more, while dwarfed undershrubs, most of them speckled with flowers, dotted the landscape. The scene *looked* barren enough, for the flowers were widely scattered, but there was no doubt of their number and variety. When, by an effort—for by this time the heat was intense, and it was a twelve-mile journey from camp—I again visited this place at the end of April, most of the flowers had already set seed and withered away under the scorching blast.

In March of another year, when beyond Baghdad, I saw more of the gravel desert. It was mid-spring then, and there had been more rain than usual. Everything looked at its best. Soon the plateau was carpeted with green, which turned to velvet saffron in the golden light of sunset. By mid April—for spring lasts longer here than it does in the south—a rich carpet of grass and flowers had sprung up. In places the plateau comes down to the river in sheer cliffs of conglomerate, but elsewhere the scarped edge of the terrace sweeps down to the alluvial plain, and has been cut up into *nallas* by flowing streams, thus smoothing the harsh outlines of what were once cliffs. A wealth of wild flowers grew here. There was a Poppy with port wine-coloured flowers, and a scarlet-flowered species, a miniature of our own glorious corn Poppy; five species of Geranium, one with lavender-blue flowers; yellow Asphodel, Rock Roses, a crimson Silene, and many Cruciferae, Leguminosae, Compositae and others. It seemed strange to find all these familiar English flowers 600 miles up the Tigris amongst the ruins of the oldest civilisation in the world; more wonderful still to find them covering the vast Temple of the Sun and other famous buildings, of which huge fragments stand wearily sentinel over the sleeping cities where now wild flowers bloom on the mounds of brick and earth which stretch away mile on mile. A maze of trenches zig-zag across the desert, and every little hollow is emerald green, spangled with crimson and yellow flowers. A greater war than that which humbled these proud cities to the dust is raging as I write, but the nodding Poppies and flaming Anemones still soften the outlines of our trenches, even as they hide the shame of the razed cities.

But it is on the gravel terraces sloping gently inland from the high cliffs which hem in the Tigris (they are 50 feet high beyond Samara) that this desert flora is seen at its best. Here we are 300 feet above sea level, and can see the blue wall of the Jebel Hamrin, the outermost defences of the mountains, 30 miles away. In March and April there were over 50 species of flowering plants blooming on the gravel at the same time. There are two things which even in spring make the struggle a keen one for the gravel flora, first the scanty soil, for the rock beneath is hard, and fierce winds sweep up the surface soil as fast as it is formed; secondly the rapidity with which water drains off. Consequently it is in the hollows into which the water drains and a little soil is washed, that the flowers cluster thickest.

Amongst the ruined cities which line the river bank are rows of shallow crater-like depressions, believed to be ancient wells. Now they are filled with luxuriant grass and tall flowers. In one are bunched the crimson umbels of an Allium, mingled with white-flowered Star of Bethlehem; in another spikes of creamy Mignonette shoot up from amidst a bed of orange Ragwort; another hollow is dabbled blood-red with flaming, scarlet Anemones; yet others are white with Daisies, violet with Hyacinth, or pink with Catchfly. Out on the dry gravel are many Cruciferae, Leguminosae, Compositae, and other flowers; but the flora is in some respects alpine, rather than desert, in its character. True we find compact, rosette plants with deep tap roots, but water-storing devices, such as fleshy leaves, or a reduced transpiration surface, are exceptional, nor indeed are they needed. Springtime on the gravel desert offers to annuals at least almost as good terms as do the cultivated areas, and larger editions of many desert plants can be found in gardens and along the banks of irrigation channels. This is especially noticeable in the case of many Compositae, Cruciferae, Leguminosae, and species of Geranium.

Real desert plants are more typical of the hard, mud desert where there is no excess of salt in the soil. A species of Polygonum, with coral-red flowers, one or two Leguminosae, Santalaceae, Potentilla, Rumex and others grow here. They all form either compact tufts with small, closely imbricated leaves, or flat, spreading plates pressed closely against the soil. This mud desert, too, round Baghdad, is green in spring, interrupted by sheets of dwarf purple Geranium. Other flowers are scattered over the

thin sward or in places make up the carpet—Malva, Ranunculus, Plantago, familiar looking flowers, but all dwarfed and compact. On a fine spring day, with blue sky overhead, and the horizon tangled up in the mirage, the desert with its sheen of grass dotted with flowers—none the less desert on that account—looks beautiful. And then comes May, with its hot breath, and all is shrivelled up, while the dust sweeps on over the ruin. *F. Kingdon Ward.*

THE ROSARY.

ROSA MOYESII VAR. ROSEA.

In reply to "A.B.B." (p. 56), there is a wild variety of Rosa Moyesii, named rosea Rehder & Wilson (*Pl. Wils.* ii. p. 325), described as differing from the type in having pale rose or pink flowers, and I think this must be the one alluded to, for I know it to be in cultivation, and it is altogether inferior as a decorative plant. It is said to be abundant in the thickets and on the margins of woods, where the type is common, and "with its large, pale pink flowers and large leaves this form looks very distinct from the type." There are dried specimens at Kew, and I cannot suggest the significance of the variation. It seems, however, to be quite constitutional, and I do not think there is any danger of the type degenerating in the same way. With regard to the colour of the type, I admit the difficulty of describing it. There is nothing like it in the genus and, from memory, I should think it comes near Ridgway's spectrum red, or cochineal. Blood-red with a touch of carmine might describe it fairly, but I deliberately chose the non-committal term deep crimson. So far as colour is concerned, I failed to find any difference between R. Moyesii and the one called R. Fargesii—here I allude to the one cultivated at Kew as R. Fargesii, but the photograph bore the same name, and was apparently identical, so that I used the term var. Fargesii to preserve the connection, in preference to making it a mere synonym. Such a colour might well receive the attention of the hybridist. *R. A. Rolfe.*

ROSE MRS. WEMYSS QUIN.

I am glad that *White Rose*, in his "Review of the Yellow Roses" (on p. 93), gives Mrs. Wemyss Quin such a good character. He states that it is the most generally satisfactory yellow garden Rose that has yet had any trial, and I thoroughly agree with this expression of opinion. We have grown and sold this variety by the thousand since it was put into commerce, and every visitor to the nurseries has admired the beautiful yellow blooms. I am astonished that one sees so few notices regarding it in the gardening Press, and this variety actually appears to have been overlooked by the majority of nurserymen. It has, indeed, every virtue claimed for it by your correspondent in his article; but he has omitted a very important one. He concluded his review by saying that "I can as yet detect no fragrance in the new Yellows." He surely did not mean to include Mrs. Wemyss Quin in that statement, for this variety is one of the sweetest of all Roses; its fragrance is remarkable. *George M. Taylor, Edinburgh.*

FIG. 56.—CORYDALIS THALICTRIFOLIA: FLOWERS YELLOW.

CORYDALIS.

The genus Corydalis is a very extensive one, the numerous species being found over the whole of the north temperate zone. The majority are somewhat weedy in character and of little value as garden plants, but a few, including the Siberian species C. bracteata and C. nobilis, may be included among the most decorative subjects. China, which is the home of a large number of species, has given us some four or five sent home by Mr. E. H. Wilson when collecting for Messrs. Veitch and Sons. These include C. thalictrifolia, illustrated in fig. 56. This species is a limestone lover and grows in rocky soil on ledges and cliffs in warm situations in West Hupeh. It is a perennial, forming a woody rhizome, and produces tufts of glaucous Thalictrum-like leaves that are very elegant, while the yellow flowers are borne on long spikes throughout the summer. Although the plant sometimes survives the winter in very dry, sheltered places, it cannot be considered hardy in this country, but if lifted and placed in a cold frame during the winter it forms a good summer-flowering plant for a dry ledge in the rock garden. This Corydalis makes a very elegant basket plant for the cool greenhouse, and has been used in quantity as a border plant in the Temperate house at Kew, where it was very effective.

Other species sent home by Mr. Wilson from Central China include C. cheilanthifolia, with fern-like, green leaves, growing 9-12 inches high and bearing yellow flowers. This is a very free-growing, hardy plant that reproduces itself freely from self-sown seed, and is worth growing for its foliage alone. C. tomentosa is a distinct plant with tufts of white, woolly leaves and yellow flowers. This species also is not hardy, but produces plenty of seeds by means of which it is readily increased. The fourth species was named C. Wilsonii in compliment to Mr. Wilson. This Corydalis (see fig. 57) bears tufts of finely-divided, glaucous leaves of a fleshy nature, and produces long spikes of canary-yellow flowers during the summer. *W. I.*

INCREASE OF VOLES.

During many years' experience of gardening, I have known no visitation so serious as our present one of Voles. We are victims both of the Field Vole (Microtus agrestis), commonly known as the Short-tailed Field-mouse, and of the Bank Vole (Microtus glareolus). Last year, 1918, there was a preponderance of the former, this year there are more of the latter species. In 1917 both were very numerous, but last year their numbers increased enormously, and this spring there are, if possible, more than ever. I do not know how many we trapped last year (the traps are never idle), but I hear of a neighbour whose gardener believes he must have trapped more than 700 in 1918; he lost count at 500. We had no Peas, the Cabbage plants were eaten; the Voles almost stripped the Brussel Sprouts, and ate into the heads of Savoys. In late summer a family of barn owls, who inhabit a dovecote here, kept picking them up, and my little terrier had great fun catching them. They have stripped the bark off limbs of Cryptomeria japonica. Iris stylosa looks as if a cow had browsed on it. Cotoneaster angustifolia, six weeks ago a solid mass of orange berries, has now scarcely a berry, and the shoots are eaten as well. On going to transplant a shapely young Pinus leucodermis, I found it ringed just below the level of the ground. Bulbs, of course, are much eaten. Big heads of fine old Yucca gloriosa are lying on the ground gnawed through at the crown. Beautiful fat buds of Camellia reticulata are hopelessly spoilt. During winter and early spring, matted-up, wall-plants are in especial danger, for behind the matting the plants are hidden from observation, and it is saddening to remove the mat and find Crinodendron Hookeri, Edwardsia tetraptera microphylla, Callistemon speciosum or some other pet plant badly attacked, and perhaps damaged beyond hope of recovery. The ground over areas of some yards square is a mass of mouse holes; a pasture which has not been fed by stock is in a similar state, while a lawn, only scythe-mown because of the war, is also riddled, though the harder turf of machine-mown grass has almost entirely escaped, such Voles as there are in this area being in places where the ground had cracked. The Voles travelled much on the surface of the grass beneath the snow, and on the melting of the snow the scythe-mown lawn resembled a railway map.

The young of these Voles, born in April, are said to breed in the autumn of the same year; and a large proportion of those we are catching now (February) are young. Among the toll of Voles we take a few Long-tailed Field-mice (Mus sylvaticus). The Field Vole, as its name implies, is not an inhabitant of the woods, but our Beech woods are infested to an unusual extent by the

Bark Vole and the Long-tailed Field-mouse—more correctly called the Wood Mouse. These mice early stripped the Thorns, White Beam, Spindle Trees and Briars of their berries, and have now been occupied in whittling the bark of Ash saplings and Hazel; they even gnaw the outer bark at the base of the Beech trees. They probably the Wood Mice) climb along the slender green twigs of the Spindle trees and leave these either ringed like Scirpus zebrinus, or all white and glistening.

The sporadic visitations of these rodents have, of course, their parallel on an immensely larger scale in other countries; there is the well-known case of the Lemming (Myodes lemmus). The writer, though he has never been in Norway in a lemming-year, has seen something of the migration of an allied species (Myodes obensis), on the coasts of Arctic Russia. Here the waste was alive with them, and many bodies lay among the sea-wrack along the line of high water.

Various accounts have come down to us of Vole plagues on the Continent.

"During the twenties," says Blasius, "the Lower Rhine was repeatedly visited by such a plague. The fields were so undermined in places that you could scarcely set foot on the ground without touching a Vole hole, and innumerable paths were deeply trodden between these openings. On fine days it swarmed with Voles, which ran about almost openly and fearlessly. If they were approached, from six to ten rushed to the same hole to creep in, and unwittingly impeded each other's progress by crowding together. It was not difficult in the crush to kill half-a-dozen with the blow from a stick." Then, he says, "the animals became mangy. When I visited the place for the third time, four weeks later, every trace of them had disappeared. People said that the whole race had suddenly disappeared from the earth as if by magic. Many may have perished from a devastating pestilence, and many may have been devoured by their fellows, as happens in captivity; but people also spoke of the innumerable hosts that had swum across the Rhine at several places in open day. In order to give some idea of the hordes of Voles which sometimes appear in certain districts, it may be mentioned that in 1822, in the district of Zabern 1,570,000 Voles were caught in fourteen days, in the district of Nidda 590,427, and in that of Patzbach 271,941."

"In the autumn of 1856," says Lenz, "there were so many Voles in one district of four leagues in circumference, between Erfurt and Gotha, that about 12,000 acres of land had to be reploughed."

There have been several such visitations in Great Britain. A Government Report on that of 1891-2, quoted by the late Mr. Lydekker (Allen's Naturalists' Library) refer to such in 1580 in Essex, 1813-14, Forest of Dean and New Forest. "Upward of 30,000 Voles were destroyed by various means in the Forest of Dean, and 11,500 in the New Forest. In 1874 and 1875, a similar plague made its appearance in Wensleydale, and lasted until about 1876, during which time the Field Voles appeared in such numbers in the pasture farms of the hill districts of the borders of England and Scotland, and parts of Yorkshire, as to destroy the grazing ground. In 1892, another alarming plague of Voles made its appearance in the South of Scotland, where between 80,000 and 90,000 acres are reported to have been affected. In his report Mr. R. F. Dudgeon said, 'the gross area of the farms seriously affected may be stated as between 30,000 and 40,000 acres. I should not be far wrong in stating that some 12,000 to 15,000 acres have been rendered entirely useless by reason of the plague. The grasses are first attacked close to the surface of the ground, and the stalk is consumed as far as it continues white and succulent; young shoots are also nipped off; and green tufts are to be seen completely eaten through, what is left by the Voles being absolutely valueless. Sheep are suffering severely in the districts affected; large portions of many flocks have been removed to winterage, wherever that can be found, artificial food and purchased hay is being given to the stock on many Nirsels. Plantations are in some cases being attacked, buds being nipped off, and bark peeled.'"

One of these writers remarks on the great number of "hawks, foxes, weasels, buzzards and owls that were attracted by the abundant prey." In this conection I may say that the number of kestrels seen last summer and up to the time of the recent snow in this part of Hampshire had been quite phenomenal. The snow lay on the ground here for about three weeks, and the inability to procure this form of food during that period seems to have shifted the kestrels to more favourable districts; we only have now (February 27) our normal pairs.

It is not impossible that the unusual appearance this year of seagulls on our pasture lands in this valley may be connected with the Voles. In the dry summer of 1893, the black-headed gulls breeding on Scoulton Mere (as I was assured by the keeper) frequently brought "mice" to their nests, killing them by dropping them from a height. The jackdaw is very fond of them. When I was a lad a pet jackdaw would often, in laying time, leave my shoulder to fly off and catch a Field Mouse, and eat it with gusto. We have no rookery here, and it is only at rare intervals that one sees a rook on our pastures, which lie down in rather a deep hollow under the steep hills, and the rooks prefer to haunt the open plateau above. Now they come here, and I lately watched gulls, rooks, carrion crows, jackdaws and magpies in one field; none of them birds that would refuse a Field Mouse. Recently, my man who was working near a stream had his attention called by a lad to a bird creeping along the foot of a hedge with a "mouse" in its beak. He tells me it was a water rail—a Hampshire "Runner." I have no reason to question it; this man has lived from a boy by water-meadows where water rails are quite common. "Are you sure it was not a moorhen?" I asked him. "Oh no, sir," he said, "that was a Runner right enough." The birds help us all they can, but what can we ourselves do? Trapping is but "a drop in the ocean," and poison is unthinkable, for it would destroy our best friends as well as our enemies. Sir Walter Elliot, writing on the Wensleydale Vole plague of 1874-5, says, "Borers have been used with good results, with which, where the soil permits it, holes are made in the ground 12-18 c.m. in circumference, and 60 c.m. deep" (about 6in. wide by 20in. deep). "When the Voles fall in, instead of burrowing their way out, they devour each other. When the fields were being ploughed, children followed with sticks, and destroyed as many mice as possible. Smoke has been driven into the burrows, poisoned grain thrown in, whole fields saturated with a decoction of strychnine or spurge. In short, every means has been adopted to get rid of this terrible pest; but in general, all these methods have proved nearly useless, and some of them, especially poisoning, highly dangerous. The most efficacious poison not only destroys all the Voles in a field, but likewise their worst enemies, and consequently our friends, foxes, martens, storks, weasels, buzzards, owls and rooks, partridges, hares, and domestic animals from pigeon to horses and oxen—a sufficient reason for abstaining altogether from the use of poison."

What can we do?

I do not know how widespread this visitation may be, and have only spoken of it as experienced in my own greenland and garden, and it is not nearly so bad on those fields here that have been regularly fed since haying time, for there is not the same cover for the Voles, and the cattle's treading also keeps them down. This irregular garden with bits of old rockwork, banks, ivied walls and harbour generally, is a natural home for such vermin. In any case the dimensions at present reached by our little local Vole plague are a very long way from those in the instances quoted above. This can only be called a plague in its infancy. Let us hope it may remain so, for it is sufficiently trying at that. Next year, by analogy, it ought to disappear. *Aubyn Trevor-Battye, Ashford Chace, Hampshire. February 28, 1919.*

FIG. 57.—CORYDALIS WILSONII: FLOWERS CANARY YELLOW.

CULTURAL MEMORANDA.

PROPAGATING PLANTS BY MEANS OF CUTTINGS.

A NUMBER of commonly-grown stove and greenhouse plants are so readily propagated by means of cuttings that no detailed directions for preparing the cuttings are necessary. On the contrary, many subjects are difficult to increase in this way, and special treatment must be accorded them in order to ensure success.

The selection of the cuttings is an all-important matter, and, generally speaking, the most satisfactory are the shoots of medium vigour. The shoots, which should be of the current season's growth, should be taken when they have lost

their succulent character and before they are fully matured. This system is very effective in the case of the majority of hard-wooded plants, provided the after-treatment is correct. They may be dibbled into clean, well-drained pots filled with a mixture of peat and sand, which has been passed through a sieve having a quarter of an inch mesh. This compost must be pressed down very firmly; when inserting the cuttings care should be taken that the lower part is securely fixed in the soil. When the pot or pots are filled with cuttings, give water freely through a fine rose, in order to settle everything in its place. They should then be placed in a close propagating case, or covered with a bell-glass. A temperature a few degrees higher than that in which the parent plants grew will be suitable for the cuttings. The after treatment will consist in removing the glass or glasses every morning, in order to admit dry air, allow the removal of decayed leaves, and for watering when necessary. It is essential that the cuttings are shaded from the sun's rays.

In the case of some subjects that are more than usually difficult to strike from cuttings, a practice often resorted to with success is to put the stock plant, from which the cuttings are to be taken, in a warmer structure than that in which it has been previously growing. This is termed by professional propagators, "drawing out the cuttings," and it is a method frequently adopted.

A point of considerable importance in the case of most cuttings—except those of a succulent character—is to insert them as soon as possible after their separation from the parent plant: if allowed to flag, their chances of success are considerably lessened. An item of considerable importance is the health of the plant from which the cuttings are taken. Highly-fed plants yield the worst cuttings, for although the growths may appear to be good, fat shoots, they do not root so well as those produced in a more natural manner. This applies to such well-known subjects as Chrysanthemums, Fuchsias, and Pelargoniums: indeed, when Chrysanthemum shows formed a more prominent feature than they do now, some specialists made a feature of cuttings from plants that had been grown naturally, and not forced with stimulants. *W. T.*

ORCHID NOTES AND GLEANINGS.

NEW HYBRIDS.

(*Continued from February 1st, page 52.*)

Hybrid.	Parentage.	Exhibitor.
Brasso-Cattleya Golden Goody	B.-C. Ilene × C. Lord Rothschild	H. T. Pitt, Esq.
Brasso-Cattleya Princess Patricia ...	C. Enid × B.-C. Cliftonii magnifica	Charlesworth and Co.
Brasso-Laelio-Cattleya Imogen	L.-C. Trimyra × B.-C. langleyensis alba ...	Flory and Black.
Cattleya Mérope	Fabia × Trianae	W. H. St. Quintin, Esq.
Cymbidium Goldflake	rosenfieldiense × glebelandsiense var. J. Davis	Armstrong and Brown.
Cymbidium International	eburneo-Lowisanum × Woodhamsianum	Armstrong and Brown.
Cypripedium Major Hanbury Carlile..	Troilus Amy Moore × Lady Carlile	F. J. Hanbury, Esq.
Cypripedium Miss Hilda Lea-Smith .	Leeanum Purity × Gratrixianum	F. J. Hanbury, Esq.
Cypripedium Miss May Murray ..	Draco × Baron Schröder	F. J. Hanbury, Esq.
Cypripedium Oakwood Giant	Alcides Harold × Beckmannii	Mrs. N. C. Cookson.
Dendrobium Erota	chessingtonense × aureum	W. H. St. Quintin, Esq.

ODONTOGLOSSUM MAUVE QUEEN.

A month ago Mr. W. H. Young, Orchid grower to Mrs. Bischoffsheim, The Warren House, Stanmore, sent flowers of the first of two plants raised between Odontoglossum Lambeauianum and O. Triton—the latter a Vuylsteke hybrid of unrecorded parentage, with a strong suggestion of O. Pescatorei in its finely-developed lip. The second plant is now in bloom, and differs from the first mainly in the colour of the blotching, which is bright rosy-mauve, the former specimen having more red in its colouring

O. Mauve Queen is an exceptionally large and pretty form, of excellent shape. The sepals are rosy-mauve, with white tips slightly tinged with purple from the back. The petals are white, with the inner two-thirds heavily blotched with mauve; and the broad labellum, which again represents O. Pescatorei in an enlarged form, is white, blotched with mauve in front of the yellow crest.

ODONTOGLOSSUM HUMEANUM AND O. ASPERSUM.

In the note (*Gard. Chron.* March 15, p. 121), under the heading "Odontoglossum Humeanum," the statement reflecting on the correctness of the record of Odontoglossum Humeanum Rchb. f. *Gard. Chron.*, 1876, i, p. 170, and which is based only on conjecture, tends to obscure the important fact that the home-raised specimen shown by Mr. Rolfe satisfactorily establishes the correctness of the name and record of Odontoglossum aspersum (maculatum × O. Rossii) Rchb. f. in *Gard. Chron.*, 1879, 1, p. 266, and by that name the plant at Kew, and others resulting from the crossing of O. maculatum and O. Rossii, must be known. O. aspersum has been noted in its various forms a number of times in these pages; it appears that the correct parentage in the Royal Horticultural Society's list of awards and Journal; in Sander's *Hybrid Orchid List*, and other publications.

With regard to O. Humeanum, it must wait until the type specimen which Reichenbach named can be seen, and the cross between O. cordatum and O. Rossii raised at home settles the question. *James O'Brien.*

ORCHID SALE.

The sale of the very select collection of Orchids formed by the late F. Menteith Ogilvie, Esq., which Messrs. Protheroe and Morris announce to take place on the premises, 72, The Shrubbery, Woodstock Road, Oxford, on Tuesday, April 1, and two following days, is one of the most important events in Orchid circles which have taken place since the sale of the remarkable Brackenhurst collection of the late Mr. J. Gurney Fowler. Some of the best plants in Mr. Fowler's collection are included in the present sale, together with a rich selection of unique forms known as "The Shrubbery" varieties, which have secured the highest award given by the Orchid Committee of the Royal Horticultural Society. Considering its extent the collection may be said to be one of the richest ever formed. Odontiodas, Odontoglossums, Miltonias, Cattleyas, Brasso-Cattleyas and Laelio-Cattleyas are the most numerous. A large number of promising hybrids, raised at The Shrubbery, are included in the 1,113 lots, the whole of which will be sold "without reserve."

NOTES FROM AUSTRALIA.

After a Christmas on the Egyptian desert, one in the Somme mud, and one in the Bethnal Green Military Hospital, it is quite a change to spend one as a civilian among the flowers of Iris Kaempferi, late Rhododendrons, Gladioli, and Liliums, not to mention the numberless species of other plants which together constitute an interesting garden. In England I had Holly berries; here the bushes are crowded with the green berries, and a fair sprinkling of red ones remaining from last winter.

Leaving England just as the spring flowers were opening (and just missing the Rev. J. Jacobs' seedling pink Freesias by about two days), I seemed at the time to have hard luck, but I landed in Australia in good time for the displays of autumn.

Although decorative horticulture in Australia had not been put aside in the whole-hearted manner which obtained in England, the shows had decreased materially both in number and objectives; the proceeds of those held went exclusively to Red Cross and Comforts Funds. The R.H.S. of Victoria did not hold an Autumn Show in 1918.

A magnificent and comprehensive display of Dahlias was staged at the Melbourne Town Hall. By some, this was estimated as the finest collection ever seen in the State. Paeony, Cactus and Collarette varieties were mostly in evidence; but show, single, Pompom, and the Cosmea flowered forms (somewhat misleadingly named Star Dahlias) were by no means neglected. Just eight days later the same hall was filled to overflowing with Autumn Roses and amongst varieties that won prizes were Mrs. Foley Hobbs, Frau K. Druschki (best Rose in the show) and George Dickson.

Some other fine things at various shows were Salamander Carnations, Chrysanthemum Louisa Pockett, and Gladioli: A five-guinea cup offered for 6 Gladioli was awarded to spikes of Mahdi, Salomé, Niphetos, Mrs. Pendleton, Joe Coleman, and a yellow seedling.

In my own garden some Liliums were apparently rejoicing at the three seasons' absence of the gardener, for surely never before had I such vigorous colonies of L. auratum, L. a. pictum, L. a. platyphyllum, L. canadense flavum, L. Thayerae, L. parda-boldtii, L. parviflorum, L. Roezlii, L. nepalense, L. dal-hansoni, and L. sulphureum The self-invited carpet of Yorkshire fog-grass (Holcus lanatus) which covered the beds seemed to supply a more appreciated shelter and drainage than any Rhododendron or Azalea. Where, in 1912, a hundred of L. pardalinum had been planted there showed but a fringe of flower stems encircling a mat of grass; but from within that circle over 2,000 stunted bulbs were duly lifted and planted out. What I had considered three years ago to be solid, crimson flowered seedling of L. speciosum was flowering freely, 50% of the flowers showing as much white as any ordinary rubrum. Some L. regale were carrying healthy seed pods, whilst others had lost their leaves and on examination were found devoid of basal roots. L. Wallacei and L. Batemanniae had not flowered but were represented by countless thousands of tiny bulbs. L. Grayii, L. Marhan, L. Alexandrae, L. parvum, L. Sargentiae, L. tenuifolium, and L. pom-

ponium, were carrying on in a desultory fashion. A few species had departed this life, and those garden acclimatised species L. tigrinum, L. speciosum, L. elegans, L. testaceum, L. Hansonii, and L. candidum, were just as one expected to find them.

L. longiflorum, in pre-war days a most satisfactory Lily, had become weary and remained below ground, although fully equipped with healthy and well-anchored basal roots. This season it still sleeps—can any reader tell me the cause and remedy for such a lazy habit? Also can any reader enlighten me as to the botanical differences between L. Wallacei (sometimes grown as an L. elegans variety) and L. Batemanniae? Also the distinctions which separate L. sulphureum from L. Sargentiae? And, whilst on the Lilium question, just where in the genus does the group called L. umbellatum find its level? Some growers give its origin as L. davuricum—which itself is confused with L. croceum. L. davuricum I have bought from various sources, true or not, but what I get looks like a very undesirable form of L. umbellatum, which seems to point to parental relationship. Here L. croceum, in time, attains five feet in height; its cultural requirements are decidedly different from the so-called L. umbellatums.

Through your columns, I should like to mention the kindnesses I experienced from English garden lovers whilst in hospital—especially must I thank your assistant editor, and Messrs. Bliss, Elwes, Ellwood and Jacob. The lovely flowers which they sent or brought did much to leaven the tedium of waiting for bones to mend; and while I scarcely expect to repay them in similar circumstances, I trust that some opportunity will occur whereby I may honour the debt of gratitude which I acknowledge. *Gilbert Errey, Errey's P.O., Victoria, Australia.*

TREES AND SHRUBS.

AN EARLY FLOWERING PRUNUS.

The sketch reproduced in fig. 58 represents a spray from some branches cut from an overhanging hedge and brought indoors at the end of January. At that time, only one or two of the buds were sufficiently developed to show the tips of the white petals just beginning to emerge from the green calyx; yet by the middle of February these branches were in full flower and formed a welcome harbinger of spring. The plant is Prunus cerasifera, known also as the Myrobalan or Cherry Plum. The tree seldom fruits in England, probably owing to its early flowering habit. It forms useful hedges, if trimmed, but then the necessary pruning gives it little chance of flowering.

Almond branches may similarly be induced to flower two or three weeks in advance of trees in the open by bringing them into the warmth of a house in January, and it is a method which is well worth trying with other early-flowering shrubs. *W. R. Dykes, Charterhouse, Godalming.*

THE VEGETATION OF THE CRATER AND SUMMIT OF MOUNT ELGON.

(*Continued from page* 123.)

The Heath Zone extends from 11,000 to 13,000 feet, to the crest of the crater, when it almost entirely vanishes, and is replaced by the wind-swept Alpine Zone of the crater and Peak—the climax of vegetation. The crater itself is saucer-shaped, at a decided tilt, and is, as a vast, bleak moorland, broken here and there by flat outcrops of rocks, hillocks, and small conglomerations of lava, sparsely covered by a bleak-looking wind-swept shrubby vegetation, studded occasionally with decrepit specimens of tree heaths with tortuous, almost black, branches covered by lichens, almost parasitic in their numbers at times. Large, solitary boulders with rocks are almost entirely absent. Everything has a look of decrepitude and senility—it needs only a few Alpine Dinosauria feeding on the Cabbage-like tree Groundsels studding these vast tussocky-grassed tracts to complete a very archaic picture.

The silence is weird, broken only occasionally by the harsh croak of the white-necked crow, or the lowing of the dwarf mountain cattle in the lower reaches of the crater. This isolation impresses one with the sense of the infinite, and the littleness of man. Even our hitherto loquacious guides appeared to be silent, though this was, perhaps, more largely attributable to physical discomfort, for the weather was decidedly inclement, persisting in sleeting, and towards and at the summit a three-inch fall of snow impeded our progress considerably.

The altitudinal effects upon my companion were most marked and somewhat terrifying. Vomiting commenced at Crater Camp, and though I adjured him not to go further, with true Celtic obstinacy he persisted in his determination to reach the summit, which we eventually did, though at a very slow rate, the journey taking us three hours from Crater Camp, instead of the usual half an hour. He became ghastly white as we proceeded, his eyes bloodshot, his ears blue, while the throbbing at the temples was very painful, and the thumping of his heart quite audible at a distance. Progress as indicated was necessarily very slow, though it gave me an excellent opportunity of foraging botanically, much "booty" being secured.

Our guides (three Bagishu) showed remarkable fortitude, and, with the exception of one, whom I left at a fire which I made at the base of the Peak (14,100 feet) to assist him in gaining the use of his limbs, reached the summit, where, with due decorum, our names were inscribed on a slip of paper and placed in the bottle under the cairn of rocks, though the cold was so intense that writing was very laboured. Unhappily the weather persisted in its inclemency, and hence we were not even granted a glimpse of the plains, a panoramic view justly regarded as truly magnificent to whom it has been vouchsafed. The fall of snow was very phenomenal, which was confirmed by a Dutchman of the Masin Gishu plateau, whom I subsequently met, who had noticed the phenomenon and vowed that he had only seen it once in the eight years he had been on the plateau.

I had the temerity to snowball my companion, but he was far too lethargic and miserable to retaliate, so taking pity on his condition and to awake his sympathy pointed out the extreme affinity of the grasslands we were traversing with those of his beloved Scottish moors, but even this failed to awake his interest, though at the trickling of a "burn" he showed some faint enthusiasm. (It is not anything alcoholic I am alluding to, though I must confess we had a "nip" of brandy at the summit, just to commemorate the feat.)

Not far from the summit there is a small crater lake, fringed by an aquatic or semi-aquatic herb, 2 inches high, which latter remains as yet a botanical mystery. The banks of this lakelet were literally covered by the spawn of frogs, as large as fair-sized peas. On our return to Crater Camp, MacLennan wished to lay down and die, and blamed his indifferent state of health to the potted meat he had partaken of at lunch, an insinuation I promptly repudiated, particularly as that part of the provender was supplied by myself. However, by a series of lurches and staggers and assisted by the guides and pinching exhortations on my part, he eventually regained camp at night, when he straightway tumbled into bed. By this time I had developed a splitting headache, and what with the discomfort of the trip (my feet being almost frozen at the summit) felt little inclined for food, and followed his example. The following morning, however, we both were ourselves again and had a thorough rest, when the next day I returned to the crater with an askari and two Bagishu, spending the whole day there and collecting further material and data.

Fig. 58.—Flowering spray of Prunus cerasifera.

The similarity of the Alpine vegetation of Elgon, Ruwenzori, Kenia and Kilimanjaro is well known, and Volken's description of that of the latter mountain mass is much in accord with what I noticed on Elgon.*

The Everlastings alluded to by Volken form one of the most decorative features of the crater vegetation of Elgon, and without them the plant-life would lose much of its charm and beauty. Their hoary, grey-felted foliage blackening with age but persistent and reflexed and enfolding the axes as if to protect them from the periodic insolation, and cold which must alternately prevail, their silvery flower-heads, often blushing in youth, and studding these bleak mooorlands, present a picture irresistibly recalling the summit of Table Mountain. On the other hand swards of a moss—a Polytrichum—obtain, just as at Inversnaid, above Loch Lomond.

Orchids are very rare (at least at the time of our visit) and were represented only by a terrestrial Disa, apparently D. polygonoides, and a two-leafed Holothrix, a minute species inhabiting the crevices of the west crater-lip. Only a very indifferent specimen of the latter was gathered. Both these Orchids show unmistakable S. Africa affinities. Precisely so in the thickets covering the occasional hillocks. Anthospermum aethiopicum, a Rubiaceous

* Schimper's *Plant Geography*, pp. 638-741.

Juniper-like shrub, abounds, the identical species covering the slopes of Table Mountain, though in the intervening lowlands it is entirely absent. Ursinea nudicaulis, a Composite, and Scabiosa Columbaria are other instances of this very marked disconnected distribution. Of more extended S. African distribution are Romulea, Dierama, Grisebachia, Protea, Crassula, and Rochea.

On the other hand a very strong northern element is apparent in the vegetation in the shape of such genera as Geranium, Erodium, Hypericum, the Chickweed (Cerastium), Stock (Mathiola), Forget-me-not (Myosotis), Wormwood (Artemisia), Clover (Trifolium), Sagina, Verbascum, and a Larkspur of the finest delicate, cobalt blue with a dash of emerald green—a most exquisite and desirable plant.

In fact we have here an extraordinary fascinating complex of plants (and animals) remnant of that vast migration of living forms from the North and South coincident with the Glacial Epoch, and of which Darwin so aptly writes in *Origin of Species*.

The savages here are represented by the Mese—literally Ratmen or Molemen, who live in the crater, apparently an offshoot of the lowland Bagishu, who live sequestered up in the world so high, and work out their destiny in herding their cattle.

They fear the European and run off at his approach. Their huts are circular, mud-walled, but have a flat (not conical) mud roof. They have no beds and sleep on the ground, their only covering when herding cattle being a goatskin over their shoulders, nor do they cultivate anything, living principally on the products of their cattle, on moles and the produce of the lowlands, for which they occasionally barter their calves and other things.

These peoples and their customs should offer a very interesting study to ethnologists.

They live free of poll tax, their numbers perhaps being 200.

These mountain tops may be likened to oceanic islands, but the surprising part of it is that, despite the extreme isolation the vegetation has been subjected to for countless ages, that the percentage of endemic types is so remarkably low.

An analysis of the one hundred and fifty species collected at the summit and crater, of which one hundred approximately are flowering plants (the remainder being Ferns, Mosses and Lichens and cannot be taken into account in the theory of the more primitive the type the more world-wide its distribution), shows only about a 10 per cent. endemism, though the Tree Senecio, the two Cabbage-like Lobelias (examples of which weigh often 25lbs.), and the three Tree Heaths (the one perhaps not a true Erica) represent endemism in a physical degree, and are sole products of these Alpine heights.
R. A. Dummer.

(To be concluded.)

FLORISTS' FLOWERS.

OLD PLANTS OF CYCLAMENS.

The illustration in fig. 59 shows a small batch of Cyclamens in their third season, the plants being in the pots they originally occupied, without being repotted. None will be so ungenerous as to ask why they have not been repotted in these times. Neither have the plants been surfaced with fresh material and nothing but what the waterpot has conveyed, including a liquid stimulant as occasion requires, has been afforded them. They have not been out of the plant-house in which they are growing during the time mentioned, with the exception of such as have been used for house decoration.

There are differences of opinion as to the need for drying off the corms of Cyclamen: I believe in drying them off absolutely. As soon as flowering is over, if water is given the plants freely, they will start to grow afresh. To guard against fresh growth, one may be guided by the feel of the foliage when watering, for moisture should not be given so long as the leaves retain their turgidity. On becoming the least flaccid, sufficient water should be given to restore turgidity and this treatment should be continued until the foliage turns yellow, when water should be withheld entirely.

To enable the plants to flower in the same pots for several seasons in succession good soil should be used and potting done carefully. The pots should be well drained and the drainage material covered with moss, or turfy portions of the loam may be used. At the final potting nothing but the best turfy loam mixed freely with old mortar rubble, and a little wood ash and bone meal, should be used, and the potting should be done firmly, pressing the soil with the fingers. In the earlier stages a little leaf-mould may be used, but the potting should be fairly firm even then.

In potting seedlings see that the young corms are just covered with soil. Plants grown in suitable conditions are not much troubled with insects. The chief enemy is the Vine Weevil, Otiorhynchus sulcatus.

Where weevils are suspected, a nightly visit should be paid to the plant house, with a good lamp. The culprits will be found devouring the flowers. A deft finger and thumb will destroy them, and this method is the only effectual remedy. It is sometimes stated that the weevils drop when a light is thrown on them, but this is not true; but the very slightest movement of their feeding ground causes them to drop and feign death. Newspaper or tiffany placed underneath the pots previous to entering the house at night will assist in their capture. *Thos. Crosswell, The Gardens, Pickhurst Manor, Hayes.*

FIG. 59.—CYCLAMENS FLOWERING FOR THE THIRD SEASON IN THE SAME POTS.

The Week's Work.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Protecting Fruit Tree Blossoms.—Apricots and Peaches will soon be coming into bloom, and preparation should be made to protect the flowers from frosts and cold winds. It is surprising how much frost the flowers will endure unharmed, provided they are kept dry; therefore, it is a great advantage to have a glass coping, or boards about 2 feet wide, fixed on brackets at the top of the wall. From these copings a double thickness of ordinary garden netting should be hung, and fastened to pegs driven into the ground. Where no coping is available it is a good plan to drive eyelets into the top of the wall, about 6 feet apart, and run a copper wire the whole length of the wall and to which the protecting material can be fastened. All protecting material should be removed whenever the weather is mild and favourable, so that the trees may be fully exposed; but it should be returned at the first sign of frost, and not removed again until all the frost has disappeared in the morning. It is not necessary to afford protection until the flower buds begin to open.

Pruning Newly-Planted Trees.—The shoots of fruit trees planted last autumn or during the winter and spring should be shortened according to the mode of training required. Maiden trees intended for fan or horizontal training should have the growths cut back to six eyes, if strong, and, if weak, to four or even two eyes. Trained trees should be shortened in proportion to the strength of the shoots, the weakest being cut back to two or three buds. Under this treatment the tree will have a good opportunity of making good healthy growths.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to C. H. BERNERS, Esq. Wolverstone Park Gardens, Ipswich.

Muscat Grapes.—If the Muscat vinery was closed as previously advised, the Vines should be bursting into growth. Let the night temperature be 55° to 60°, with a rise of 10° by day; admit air freely in bright weather, but prevent cold draughts reaching the young, tender foliage. Disbudding should be done as soon as it can be seen which growth is the most suitable to retain. Atmospheric moisture should be afforded liberally but not in excess, for that would encourage thin, flimsy growth. Syringing the Vines may now cease. Houses set apart for Muscats, if not already closed, should be started forthwith. If the borders are dry, give them a thorough soaking with water warmed to a temperature of about 60°.

Cucumbers.—Early Cucumber plants are making roots freely, and require frequent top-dressings of good loam as the roots appear on the surface. When the plants are fruiting freely, watering with warm liquid manure once or twice each week will be of material assistance. Do not allow the plants to become unduly weakened by carrying heavy crops. Give regular attention to the stopping and training of the young shoots, and see that the foliage is not crowded. As the days lengthen and the sun gains power, plenty of atmospheric moisture should be maintained in the house, while syringing may be done liberally as a preventive of red spider. Provided a constantly moist atmosphere is maintained very little ventilating will be needed at this time of the year.

Early Vinery.—The Vines will now have reached their full leaf-development, and, on completion of the operation of thinning, the berries will swell rapidly until the stoning period is reached. The bunches should be examined occasionally and have superfluous

berries cut out, sufficient space being allowed for the final swelling without undue crowding of the fruits. Anything approaching drought at the roots must be carefully avoided. Where the borders are well filled with roots, stimulants should be liberally afforded. An equable atmospheric moisture should be maintained, by damping bare spaces at suitable intervals; the frequency of this operation should be governed by the weather, and an excess of atmospheric moisture must not be permitted. Admit air freely during the day whenever the weather is favourable, and at night leave the top ventilators open to the slightest extent. Afford a night temperature of 60° to 65°, with a rise of 10° during the day.

Orchard House.—Where the trees were started early to provide fruit well in advance of outdoor supplies, most of the fruits of Cherries and Plums will now be swelling freely. At this stage, steady forcing is necessary, and when the final swelling commences increased warmth may be given with advantage. On the appearance of green fly, fumigate the house, and thoroughly syringe the trees the following morning. Pot trees will require frequent applications of weak liquid manure at the roots, varied at intervals with soot-water and a suitable artificial manure. Planted trees may have a mulch placed on the borders, and there is then less need of water, and the slight amount of ammonia given off is beneficial. Syringe the trees freely on bright days, maintaining a temperature of 55° by night, with 10° rise by day without sun-heat. Afford plenty of air when outside conditions permit. All side growths not required for extension should be pinched at the fifth or sixth leaf. Certain varieties of Plums often set more fruits than the tree can properly develop, and where fine fruits are desired it is necessary to thin them to reduce the strain on the tree; but this should not be done until it can definitely be ascertained which fruits are likely to swell properly.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park Gardens, Barnet, Hertfordshire.

Rock Garden.—Where the Rock Garden has been much neglected during the past four years, it should be overhauled, thoroughly cleaned, and replanted. If the work is carefully carried out the plants will soon spread and give a good effect.

Plants in Tubs.—Ivy-leaved Pelargoniums growing in large tubs or pots will need a thorough examination. See that the trellises are made strong. Thin out some of the old wood and train in the young shoots, but avoid overcrowding. Give the roots a good soaking with tepid water and a top dressing of rich loam mixed with leaf-mould and decayed manure: then stand the plants in a newly-started vinery to encourage fresh growth. If new tubs are to be filled the drainage should be efficient and the compost sweet and lasting. Plant rather firmly but do not over-water.

Fuchsia.—If not already pruned bring Fuchsia plants from their winter quarters, prune them, give the roots a good watering and any other attention needed. Stand the plants in a house where there is gentle warmth and syringe them freely during fine weather to encourage good flowering growth. Fuchsias make splendid plants for terraces or for plunging in the ground in special positions in the flower garden during the summer months. Their principal requirements are plenty of water and liquid stimulants at the roots, and frequent syringings under the leaves to keep them free from thrip and other insect pests.

Perennial Asters.—To obtain good results with Michaelmas Daisies the plants should be renewed annually. The ground should be deeply worked and well enriched with decayed manure. Plant small clumps taken from the outside of the old stools, taking great care to arrange the plants according to their respective heights and colours.

Gladiolus.—If the Gladiolus corms have started to grow, set them out 4 inches deep in well-prepared soil containing a good supply of thoroughly decayed manure. There are many very useful varieties for making a brilliant display in either beds or borders. The old G. Brenchleyensis is the hardiest and is most useful where a dazzling scarlet colour is required.

Ferns.—Hardy Ferns will now be commencing to grow and will need a good clean over. Divide and replant those that require such treatment, and use fresh, sweet soil to give the plants a good start.

Lavender.—The stock of Lavender may be increased by pulling off quite large pieces from the old plants and planting them rather deeply. These quickly form roots and grow very rapidly. Plant very firmly, and should the weather be dry, supply water occasionally.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Phaius.—With the exception of one or two species, the genus Phaius is a most useful one for establishments where no houses are set apart for the cultivation of Orchids. The species and hybrids are easily grown, of handsome appearance at all seasons, and free-flowering. During the season of growth the plants require a liberal supply of water at the roots, and should be placed in the warmest part of the intermediate house. When at rest, the coolest part of the latter structure is most suitable, and for a considerable period very little water is required; a resting period is conducive to free flowering. The plants should be shaded from direct, hot sunshine, and a close, stuffy atmosphere, which causes the leaves to become spotted and decay at the tips, should be prevented. Repotting is best done in early spring, when new growth commences. The terrestrial kinds should be placed in well-drained pots, and potted like ordinary plants, *i.e.*, below the level of the rim of the pot. A good compost consists of equal parts of peat and fibrous loam—with the fine earthy particles shaken out—to which should be added a small proportion of chopped Sphagnum and a sprinkling of crushed crocks and charcoal. When the receptacles are filled with roots, weekly applications of weak liquid manure are very beneficial during the period of most active growth, and add materially to the vigour both of the foliage and the flower-spikes.

Epiphytal Species.—The tropical, epiphytal species, P. Humblotii and P. simulans, need a warmer house than the terrestrial ones, and moister conditions. They should be grown in a compost of A1 fibre and Sphagnum-moss. As P. simulans has ascending rhizomes, the plants should be fastened to a teak raft. The foliage of all species of Phaius is very subject to attacks by insect pests. The plants, therefore, should be placed so that the foliage may be syringed freely.

PLANTS UNDER GLASS.

By JAMES WHITOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Celosia pyramidalis.—This is a good decorative plant for the greenhouse or conservatory. Sow seeds in pans of finely-sifted light soil and place in a temperature of 60°. To grow Celosias successfully it is essential they receive no check in the successive stages of development. First pot the seedlings into 2-inch pots, and place them near the roof glass in a warm pit or house; repot into larger pots before they are root bound and guard against a check by shifting them into their flowering pots at an early date. The compost for the final potting should consist of equal parts of good loam and leaf-mould, rotted manure and coarse sand.

Roses.—Roses in pots or those growing in greenhouse borders do best in a cool or intermediate temperature when coming into flower. Cold draughts must be carefully guarded against to prevent mildew. Give occasional syringings with a weak insecticide to prevent attacks of green fly. It is necessary to feed the plants when in flower, and probably one of the best and least offensive manures to use is sulphate of ammonia in weak solutions. All blooms, either for room decoration or for packing, should be cut in a bud state, twelve hours before required, and placed in water in a cool place.

Begonias and Gloxinias.—Seedlings showing the first rough leaf should be pricked off into clean, shallow, well-drained pans filled with light sandy soil. The work of transplanting should be carefully done, afterwards placing the pans near the roof glass in a warm house, and giving shade from strong sunshine. A light spraying overhead will be sufficient watering for a time.

Zonal-leaved Pelargoniums.—The stock in 4-inch pots should be shifted into 6-inch pots, in fibrous loam, mixed with leaf-mould; add some gritty rubble, and a 6-inch potfull of a plant-fertiliser to each barrowful of the compost. Place the plants in a warm greenhouse until some growth is made, when they may be shifted to cooler quarters. When the shoots are of sufficient length, pinch out their tips.

Aspidistra.—The Aspidistra is not serviceable in large pots, and specimens which have become too large may be divided, potted in a mixture of loam, leaf-mould and some lime rubble, and placed in a warm house.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Cauliflowers in Frames.—To obtain early Cauliflowers when these are generally scarce, planting in frames should be resorted to. Proceed by digging in some well-decayed manure, even adding fresh soil if necessary; then finish off by giving a dressing of soot to the dug surface. Set the plants 15 inches apart each way, and fill in between the lines with the early sown Lettuces that were previously pricked off in boxes. With proper attention as to airing, hoeing and spraying, the Lettuces should be ready before the Cauliflowers require the space. Early Turnips and Spinach can be sown if all the space is not required for Lettuce.

Autumn-sown Cauliflowers.—These have stood the winter well, and have consequently become fine sturdy plants. Provided they have been well hardened off, they will now be in a good condition for planting out, therefore, whenever the plot is in a workable condition proceed with planting on a site that has been well prepared, as Cauliflowers delight in a rich medium. The distances to plant will naturally vary with the varieties, but 20 inches by 15 inches and 30 inches by 24 inches for the more vigorous types will suffice. A screen of evergreen boughs should be placed on the northern side to ward off the cold spring winds. If slugs abound place a ring of sifted cinder ashes around each plant at the time of planting, close up to the stems.

Seakale.—Where a breadth of Seakale remains out of doors it will prove most useful, particularly during a season like the present, when green vegetables have been badly damaged by the frosts. A few rows should always be kept in the open for cutting during April, when it is most tender and delicious cooked. Give the plot an occasional hoeing, and dust the soil with soot.

Parsnips.—Should any Parsnips remain in the ground, they should be dug up at once and covered with fine soil or ashes.

Peas.—From this date onwards the more tender marrowfat Peas can be safely sown in the open, whenever the ground is in a friable condition. Tall-growing Peas require a distance of 6 feet between the lines. Draw drills deep enough to form shallow trenches when the seeds are covered, as a depression is beneficial for watering and mulching during the dry times.

Peas in Boxes.—Seedlings in boxes must be gradually hardened off by placing them in cold frames, and ultimately withdrawing the lights.

EDITORIAL NOTICE.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Editors and Publisher.—*Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, MARCH 25—
Roy. Hort. Soc. Coms. meet.: Lecture by Mr. Edward White at 3 p.m. on "The Study of Economic Botany and the Professional Openings it Offers."

WEDNESDAY, MARCH 26—
Wargrave Gard. Soc. meet.

FRIDAY, MARCH 28—
War Hort. Relief Fund Matinée at the Palladium.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 43.0°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, March 19, 10 a.m.: Bar. 29.4; temp., 42°. Weather—Rainy.

Nitrogen Fixation by Root Nodule Bacteria.

It is now more than thirty years ago since the nitrogen-fixing power of the bacteria present in the root nodules of leguminous plants was finally demonstrated. During this time much of practical importance has been discovered. The bacteria have been isolated and cultivated in artificial media. Their mode of entry into the root and their power to stir up the cortical cells to abnormal growth are known; yet even now much remains to be discovered. Of the many outstanding problems, perhaps the most important is that—often asked and never satisfactorily answered—which concerns the power of the nodule-bacteria to associate themselves with non-leguminous plants and to bestow upon them powers of nitrogen fixation.

The discovery that sundry other plants enter habitually into association with micro-organisms and form in consequence nodule-like growths on their root system, led naturally to the suggestion that these symbiotic unions, like those occurring in leguminous plants, conferred on the plants which entertained them like powers with those enjoyed by Leguminoseae.

Among non-leguminous nodule-producing plants are species of such genera as Alnus, Ceanothus, Cycas, Elaeagnus, Myrica and Podocarpus, and sundry investigators have claimed to show that nitrogen fixation occurs in them, and have inferred that it is due to the symbiotic association. Other observers have gone further, and having discovered that certain plants habitually associate themselves with certain fungi, claim that these unions also confer on the contracting parties the power of drawing upon the free nitrogen of the air for their supply of nitrogenous food. It is, however, doubtful whether the evidence advanced in any of these cases is as conclusive as it is in that of the Leguminoseae. Indeed, and in the case of the non-leguminous nodule-bearing plants, the most recent evidence tends to throw doubt on the claim that they are nitrogen fixers, or at all events justifies the demand that more rigorous proof shall be forthcoming before this view is finally accepted. Thus in this last published work* the late Thomas J. Burrill shows that the non-leguminous nodules differ in certain respects from those of the Leguminoseae in that they are not caused by Pseudomonas radicicola, the bacterium present in the root nodules of leguminous plants.

This conclusion is in disagreement with that reached by Prof. Bottomley and his co-worker, who claim in the cases of Cycas, Alnus and Elaeagnus, to have isolated Pseudomonas radicicola from their nodules.

In the light of the more recent work of Prof. Burrill, this conclusion must now be regarded as doubtful, and these plants must be rejected, at all events provisionally, from the category of nitrogen fixers.

The case of Alnus glutinosa is somewhat different; for notwithstanding the fact that Prof. Burrill has shown that the nodules do not contain Pseudomonas radicicola, there is some experimental evidence which indicates that nitrogen fixation does actually take place in this plant. It would be well worth the while of botanists to take up this question once more and to ascertain first, whether fixation of nitrogen does occur in Alnus and other non-leguminous nodule-bearing plants, and second, what is the intensity of fixation as compared with that of leguminous plants. For apart from the purely scientific aspect of this subject, there is this most important practical aspect: that if some non-leguminous plants are in fact able to fix atmospheric nitrogen it should not be impossible to train others to do the same beneficent work. This, indeed, was the main object of Prof. Burrill's work. Having made the most careful study of the habits of the nitrogen-fixing bacteria, he endeavoured to induce this organism to enter into a union with non-leguminous plants—as, for example, the Tomato. His experiments were not, however, crowned with success, and so far as they may be regarded as final we have to be content with the conclusion that symbiosis between the nitrogen-fixing organism and non-leguminous plants is impossible. This conclusion is in general harmony with the facts discovered by Prof. Burrill with respect to what may be called the catholicity of infectiveness of the nodule organism.

Although Pseudomonas radicicola must be regarded as one species, it forms a series of biological races, each of which is capable of infecting a restricted number of leguminous genera. From Burrill's researches it appears that some eleven races of P. radicicola may be isolated. Of these, one race confines its activities to species of Trifolium, and can transfer itself from one of these species to another, for example, from Mammoth Red Clover to Alsike, Crimson Egyptian, White or Cow-Clover.

Another race is more catholic and may infect species of Sweet Clover (Melilotus), Medicago (Alfalfa, etc.), or Trigonella. A third race is common to no fewer than eight genera of legumes—Vigna, Cassia, Arachis, Lespedeza, Mucuna, Desmodium, Acacia and Genista. A fourth race is competent to infect Pisum, Vicia, Lens (Lentil) and Lathyrus, whereas a fifth race confines its attentions to the Soy Bean. Similarly, Phaseolus enjoys the exclusive use of a sixth race of Pseudomonas, whereas the Lupine and one other genus share the favours of yet another race of the nodule organism. The Hog Pea Nut (Amorpha canescens), the trailing Wild Bean (Strophostyles helvola), and the common Locust (Robinia Pseudacacia) have each a race of their own.

From these facts it must be concluded that the conditions which lay a plant open to infection are highly specialised—that the gate by which infecting organisms enter the plant is straight and the way narrow. The problem that awaits solution is this: Can man succeed in doing what Nature has apparently failed to accomplish, i.e., train plants and nitrogen-fixing bacteria so to accommodate themselves to one another as to admit of a symbiotic union, as a result of which every cultivated plant may, "without sweat or endeavour" in the shape of added nitrogen-fertilizer, make use of the atmospheric nitrogen as a source of food supply?

* *Is Symbiosis Possible Between Legume Bacteria and Non-Legume Plants?* By Thomas J. Burrill and Roy Hansen. Bull. 202, Univ. of Illinois Exp. Station, 1917.

Royal Horticultural Society's War Relief Fund.—Colonel Charles Gulliver is arranging a Serbian Matinee in aid of the Royal Horticultural Society's War Relief Fund at the Palladium on Friday, March 28th. The proceeds of the matinée are to be allocated to Serbia and will be administered on behalf of the R.H.S. War Relief Fund in Serbia by the Serbian Relief Fund. Queen Alexandra has granted her patronage to the matinée, and a good programme is being provided by leading artistes. In place of the usual sale of war relics, Mr. Charles F. Higham, M.P., will hold a Surprise Auction.

Prizes at the National Potato Exhibition, Birmingham.—We understand that Messrs. Webb & Sons are offering £100 in prizes for Potatos at the National Potato Exhibition to be held at Birmingham in November. This amount is to be awarded for the varieties Colonist or Express, Guardian, Goldfinder, Prosperity and Great Scot, £20, in five prizes, for each variety. Six tubers of each variety are required.

Mr. James Comber.—Mr. James Comber, who has represented Kensal Green on the Middlesex County Council for two years, fought a very stiff contest for his seat at the recent election, and was returned with a majority of 130, on a vote of 1,138. Mr. Comber is manager for Messrs. Strudwick, Florists, Westbourne Grove. For eight years he has been a member of the Willesden District Council and was, for one year, chairman. At that time he was chiefly instrumental in obtaining the Dollis Hill House hospital for wounded soldiers, for which the historic mansion in Gladstone Park, associated with Gladstone and other celebrities, was used. Mr. Comber has given liberally of his professional knowledge to his adopted district, and has improved the gardens attached to municipal institutions in Willesden in many respects.

Back to the Land and Country-side Exhibition and Conference.—An Exhibition and Conference on matters relating to land cultivation and country-side pursuits is to be held at the Royal Botanic Gardens, Regent's Park, during the months of July, August and September. The aims and objects of this Exhibition and Conference are as follows: (1) To interest and educate the public generally in all matters connected with Agriculture and Horticulture; (2) to encourage and foster Agriculture and Horticulture, and to better the conditions on the land; (3) to improve, by means of a conference, present methods of co-operation on the land, and to obtain new facilities for transport; (4)

to show by actual demonstration what a small land holding is, and how it can be worked to the best advantage; (5) to help forward the question of rural housing and to show actual models of rural houses and cottages; (6) to generally ameliorate the existing conditions of village life; (7) to generally improve sanitation in country houses and cottages; (8) to encourage fruit planting and forestry; (9) to show, under one roof, at one time, the latest appliances used in Agriculture and Horticulture, together with all articles necessary for furnishing and decorating country houses and cottages, and their environment: and (10) to help and encourage emigration, and to show the products from overseas, and the methods of obtaining them. During the whole time over which the Exhibition and Conference will extend every endeavour will be made to make a visit enjoyable as well as instructive. The best string and instrumental bands that are procurable will be engaged to play during the afternoons and evenings, and refreshments will be served in the beautiful gardens attached to the grounds of the Royal Botanic Society.

Spraying for Big Bud Mite.—Experiments carried out by Mr. A. H. Lees at Long Ashton, indicate that to control Big Bud Mite a mixture consisting of 10 per cent. soap and 5 per cent. crude carbolic acid is of value, particularly if the spraying is repeated twice or thrice. The first spraying should be done early, say at the beginning of December, and the later sprayings in January and February.

National Seed Testing Station.—The Food Production Department reports that the Seed Testing Station, established in November, 1917, to enable seed sellers to comply with the provisions of the Testing of Seeds Order and to provide growers with information on the quality of the seeds which they purchased, dealt with over 14,000 samples during 1918. A Sub-Committee of the Consumers' Council of the Ministry of Food, which was appointed to consider whether any of the measures taken by the Ministry of Food should be continued in peace-time, has passed a resolution regarding the Testing of Seeds Order as follows :—

"In the opinion of this Sub-Committee it is desirable that the testing process embodied in the Order be made part of the permanent legislation of the country, and, if possible, extended."

Representatives of the Agricultural Seed Trade Association of the United Kingdom have also expressed a hope that the Order will be made a permanent legislative measure.

The Dressing of Seed Grain to Protect it from Birds.—The usual dressings used to protect seed corn from birds are made from tar. The different kinds of tar vary in usefulness, and the Food Production Department of the Board of Agriculture have recently had tests of different tar dressings made at Rothamsted Experimental Station. No dressing tested gives absolute protection, and most of them injure the seed unless carefully used, but in certain cases rooks and other birds may cause so much damage that seed dressings are desirable. The best form of tar that has been tested is acetone tar. This is only supplied by the Ministry of Munitions (Propellants Branch, 32, Old Queen Street, London, S.W.1). Supplies are available in Essex, and in the Forest of Dean, Gloucestershire, and the current price is about 80s. per barrel at the works. To secure this product growers who do not require a 40-gallon cask should combine and secure delivery of a barrel through a dealer. The method of treatment is to sprinkle 1 pint of tar on 4 bushels of grain, and turn the seed over and over until the tar is uniformly distributed. The seed, if spread out, should dry in a day. If the tar is too thick for handling, as it is in cold weather, it must be warmed before use. This may be done by standing the vessel containing the tar in hot water. Ordinary coal tar is often used for dressing seed; it is rather variable in nature and is not quite so safe to use as acetone tar, but if the coal tar usually met with is used as follows, the risk of injury to the seed is slight. One pint is applied to 4 or 5 bushels of grain in the same way as acetone tar. If necessary, this may be thinned down with one-third its volume of paraffin oil and applied at the rate of 1 pint to 5 or 6 bushels of grain. This may be dried off with lime. Bone oil affords great protection to the grain, but is harmful if used alone. When dried off with lime it may be used with safety. One pint to 4 bushels is applied in the same way as acetone tar; 2—3 lbs. of lime are added as soon as the bone oil is evenly distributed, while the seed is still wet. The grain is then turned over and over until each seed is covered with lime. The oil has an objectionable smell. Blast furnace creosote affords less protection than the tars, but may be used at the rate of 1 pint to 4 or 5 bushels when tars are not obtainable. In dressing seed by any of the above methods, the most important point to remember is that the mixing should be thoroughly carried out, and the mixture used as directed. The material will then have little or no adverse effect on the germination of the grain.

Fig 60.—Freesia Daddy Longlegs; colour light rosy-mauve.

Freesia Daddy Longlegs.—In recent years plant breeders have raised many beautiful varieties of Freesia and the one illustrated in fig. 60 named Daddy Longlegs gained an Award of Merit at the meeting of the Royal Horticultural Society on the 11th inst., when shown by the Rev. Joseph Jacob. As will be seen from the illustration, which shows the flowers slightly reduced in size, the segments are more reflexed than in those of the older type of flower, so that the mouth appears very wide. An additional quality is the large number of flowers on the spike, many of these exhibited having no fewer than seven. The colour is light rosy-mauve, with a golden blotch at the base of the lowest segment, and a shade of purple on the lobes on either side of the blotched one. The great charm of the Freesia is its delicious perfume, and this, together with the fact that the flowers are available at a time when other flowers are scarce, makes them very popular for market purposes. Moreover, they have a certain elegance and lightness of form which render them suitable for indoor decorations and general florist's purposes. At this time of the year large numbers of Freesias are sold in Covent Garden and other flower markets in this country, the Guernsey growers sending immense quantities annually; indeed, so plentiful are the flowers that numbers are secured by the street hawkers, who retail them for a few pence per bunch.

Journal of the Kew Guild.—The *Kew Guild Journal* for 1919 is as interesting as previous numbers. The frontispiece is a portrait of Mr. George Stanton, the President for 1919. Mr. Stanton entered Kew in March, 1862, and served the usual period of two years, during which time he gained prizes for botany. For a long time he was gardener at Park Place, Henley-on-Thames, one of the most beautiful estates in the Thames Valley. The doings of the members of the Kew Guild make very interesting reading. Considerably over one hundred and fifty Kewites served with His Majesty's Forces in all parts of the world, and no fewer than twenty-four have made the supreme sacrifice. Several interesting letters are published from Kewites on active service, including one from Mr. A. W. Maynard and another from Mr. Guy Neville—both of whom relate their experiences as prisoners in Germany. Many interesting items of news are given under Notes and Gleanings. We learn that the number of visitors to the Gardens during 1918 was 640,729, and that the admission fees amounted to £2,564 12s. 3d. The wages of the garden staff have been considerably increased, and under-gardeners are now paid 47 shillings weekly, including a war bonus of 23 shillings. Labourers are paid 49 shillings, of which 25 shillings represents a war bonus. Instead of the sum of 3s. 6d. formerly paid for Sunday

duty the remuneration is now fixed at 1s. 6d. per hour, and overtime is paid for at the rate of 1s. 3d. per hour. The part taken by Kew in increasing food production is referred to, and an excellent illustration shows the lawn in front of Kew Palace being ploughed for a Potato crop. The usual list of names and addresses of old Kewites is deleted from the current number, owing, doubtless, to the increased cost of printing and paper.

Notes from Belgium.—Mr. Backhouse, of York, has received a long letter from the firm of De Smet Frères, Ghent, which he has kindly forwarded to us for publication. The communication states that the Germans arrived in Ghent on October 12, 1914. "In September we had already some battles in our neighbourhood, but we did not suffer and we went to visit the battlefields. On October 5, English and French soldiers arrived at Ghent and the battle was resumed. It lasted until the 11th, when the Allies retired. We established our daughters at Heyst with our two grandchildren. They fled from there on October 14, and went to England, where they are now, but we expect them back here every day. They settled at Teddington, near Hampton, and have been very happy there and words cannot express how grateful they are to the English. Mr. Snow, of Bush Hill Park, took them under his protection and Mr. Eisele, of Henry A. Dreer, Philadelphia, provided them with money. We knew all that and were very contented and happy, although we had scarcely a letter from them. Germaine, our eldest daughter, has been a nurse in the Red Cross Hospital at Teddington. Our second daughter, Yvonne, is married and was there also with her two children. Her husband, a soldier and doctor, is still in the army. He was promoted to the grade of Médécin de Regiment, to 2nd classe lieutenant and decorated with the Cross of War. He was in the battle which delivered Ghent, and we were proud to see him coming in our city with his regiment. Everything has been very dear and very scarce. Nearly every month the German soldiers came to our houses to look for plunder. They requisitioned all our copper, wool, leather, bicycles; our meat, ham, eggs, butter and other food in the house they took away. But we put most things away in security and they could only find a little plunder. They are thieves and murderers, but we bore everything with courage, knowing that we would be victorious. From October 25 to November 11 last we had very dangerous days during the battles around Ghent. The Germans had put sixty cannon close to our nurseries, and we heard during all those days the shells flying and whistling over our nurseries. We slept in cellars. Several dwelling houses have been disturbed in our neighbourhood, but we suffered no more damage than a lot of glass broken by shrapnel and the explosion of the railway bridges and railways."

Damping off and Collar Rot of Tomatos.—The disease which causes the damping off of seedling and young Tomato plants has been traced by Mr. G. T. Spinks to the action of a fungus, a species of Phytophthora, which gains access to the young Tomato plants from the soil. Sterilization of the soil appears to be a sure preventive of the disease.

Wart Disease of Potato Order.—The Board of Agriculture and Fisheries desire to draw attention again to the fact that under Article 4 of the Wart Disease of Potatos Order of 1918 no person is allowed to sell or offer for sale for planting any Potatos of varieties approved by the Board as immune from Wart Disease except under a licence from the Board, unless the sale is to a dealer direct. The object of this requirement is to secure the supply of pure seed of immune varieties for planting, since the planting of mixed stocks in soil infected with Wart Disease is calculated to increase the spread of infection. The licence is readily granted in respect of stocks that were examined and certified by the Board's inspectors in the growing season; in other cases enquiry has to be made before the licence can be issued, and growers of immune varieties during the coming season will be well advised to apply to the Board for the examination of their growing crops in order to avoid delay in issuing licences next year.

"Reversion" of Black Currants.*—According to the investigations of Mr. A. H. Lees, the malformation of Black Currants commonly known as Reversion is to be ascribed to the development of two weak lateral buds instead of the normal strong terminal. The causes which lead to the replacement of the normal terminal vegetative bud are various. The check to the terminal bud may be due to attack by Big Bud mite, and in this case the growth of two lateral buds results in the production of malformed shoots. In other cases weakness of the plant may result in the terminal bud becoming not a vegetative but a flower bud. This bud is, in reality, a mixed bud—that is, beside the terminal flower bud it bears two lateral growing points, and by their development Reversion is produced. Since a terminal flower bud is only produced on shoots making weak growths, the author suggests that it should be possible to control Reversion by suitable methods of pruning, and thinks that Reversion may often be a result of improper pruning. In support of this view he points out that a sucker in its first year makes strong growths and has nearly always a terminal wood bud. In the second year, the growth though weak is still strong enough to result in the production of a terminal wood bud; but in the third and fourth year the growth is still weaker and nearly always result in a terminal flower bud. Therefore, if suckers are allowed to grow for three or more years there will always be a prospect of Reversion appearing, and so pruning should be such as to remove all wood of more than three years' growth, and to allow only a little three-year-old wood to remain. Lastly, aphis attack in the previous year leading to a check may result in the development of two terminal growths instead of the normal one, and here again those symptoms of malformation known as Reversion may make their appearance.

* *Reversion in Black Currants.* By Mr. A. H. Lees, Annual Report, Agricultural and Horticultural Research Station, Long Ashton, 1917.

THE ALPINE GARDEN.

SAXIFRAGA KELLERERI.

This Saxifrage is undoubtedly one of the best of the red-flowered (Engleria) hybrids. The plant has a good constitution, is a free grower, and among other good attributes has more than a little tendency to profuse flowering—a matter hinging largely apparently on its continued growth and the successional development of flowering rosettes. For example, both this year and in 1918 the plant began flowering in January, and though March is the more usual time it not infrequently also gives a few spikes both in April and May. These are matters of which the hybridist or plant breeder should take note, since it affords a means whereby these early gems of the race may be employed in conjunction with later flowering kinds for purposes of cross-breeding. Requiring little or no protection, the plant is seen to the best advantage in the rock garden, where a colony of its red tinted flowers offers a novel and distinct feature. In an alpine house or frame the red tint passes away all too quickly; indeed, the enhanced colour-beauty assumed by the hybrid when grown in the rock garden is not developed with glass protection. Well-grown rosettes may be two inches across, and such as these give good sprays of flowers. The plant grows quite readily in gritty, well-drained loam.

SAXIFRAGA BURSICULATA.

It did not occur to me when looking about for a suitable name for this hybrid, which I was instrumental in raising nearly a decade ago, that the one eventually compounded and adopted clashed with a practically identical one having botanical significance—bursiculata (from bursa a purse). In the circumstances, the name of the hybrid would, I suppose, have been more correctly rendered thus — Burs-iculata. In order, however, that it may not be mistaken for a species in future years, it may be well to state that it was the result of crossing S. Burseriana major (the true plant) with pollen of S. apiculata. The hybrid possesses the good attributes of both parents and is a capital grower. From the pollen parent it inherited the bunch-flowered truss and not a little of its vigour; from the seed parent red-tinted stems and purity of tone—that sparkling whiteness which renders the true major form of Burser's Saxifraga all but unique. In the alpine house the red tinting of the stems is not developed. In a sunny position in the rock garden it is to the full, and, contrasting with the pure white of the flowers, the effect is particularly good. In substance of petal the hybrid surpasses both parents. The flowers, too, are rounded and well formed. The shape of the rosettes generally is that of S. apiculata touched with the silvery grey which characterises the other parent. The plant is easy to cultivate and grows well in sandy loam or that to which a free addition of old mortar has been made. *E. H. J.*

SAXIFRAGA APICULATA.

In planting this well known species, its precocious flowering should be kept in mind, so that colonies may be arranged in diverse positions and aspects. In abnormally mild winters like the present one the plant is continually in growth and flowering early, not infrequently is injured by frost. I have seen large patches of plants in sunny positions bearing, probably, hundreds of flowering sprays, cut completely off in their prime, whilst others, afforded a western exposure, have escaped uninjured. That there is more than one form of the plant is well known to cultivators, and since these differ in habit, time of flowering, sturdiness and strength of flowering stem, all are worth growing in order to secure a prolonged season of blooming. Moreover, by obtaining the several forms the cultivator is afforded an opportunity of weeding out the undesirables, which are rarely capable of standing erect. That known as S. a. Malvi is later flowering than the rest, though the plant is often sold as the ordinary form. Curiously, each of these variations has its white counterpart, an interesting fact which makes them alike desirable. *E. H. Jenkins.*

A GARDENER'S NOTICE.

By the Solicitor to the Chamber of Horticulture.

THE question of the amount of notice to which a Gardener is entitled before he is dismissed from his situation, or before the terms of his employment can be varied, has often been a subject of doubt in Horticultural circles. Now that so many gardeners are returning to work, on demobilisation from the Army, a few notes on the subject may possibly be of help in avoiding disputes hereafter.

In the first place, it should be borne in mind that a clear agreement in writing, if only in the form of a letter by one of the parties, is always the safest plan. The absence of a definite understanding often leads to unpleasantness in the future and a written document is worth far more than any amount of legal argument, in addition to being a good deal cheaper.

In cases where the parties are wise enough to put the terms of their arrangement into writing no difficulty should arise, as they are at liberty to agree to any terms they think fit, without paying regard to law or custom, with the exception of special legislation such as is to be found in the regulations of the Wages Boards, or in the Truck Acts, which prohibit various deductions being made from wages.

The trouble usually arises where a contract for service is entered into without anything being said on either side as to the length of notice which either party is to give to the other if it is desired to terminate the employment. In this case, the parties are thrown back on "custom," but in the present instance it is by no means easy to prove what the custom is. Cases between employer and gardener are heard in the County Courts from time to time, but the decisions of a County Court Judge are not binding on other Judges, and it needs a decision of the High Court of Justice to make case-law which would be binding on the country generally.

In the case of a head gardener in private service, the position is somewhat simplified by the fact that in the year 1835, the well-known case of Nowlan *v.* Ablett came before the High Court. Times change and the law changes with time, but it is not unreasonable to suppose that, if similar facts should again come before the Court of Appeal at the present day, the Judgment in that case would still be followed.

In Nowlan *v.* Ablett the facts were that a head gardener agreed to serve his employer for the space of one year, the wages being £100 per annum, in addition to the right to live rent free in a separate house on the estate. He had the supervision of five under-gardeners and was allowed to take two apprentices at a premium. At the end of nine months his employer gave him a month's notice, and considerable stress was laid by the Employer on the fact that the man had previously left a situation at the Royal Gardens, Kew, on receipt of a fortnight's notice. On entering the situation in question, nothing had been said as to the length of notice to be given on either side, and the question therefore arose as to whether the plaintiff was a yearly servant entitled to wages till the end of the year, or whether he was a "menial" servant entitled only to a month's notice.

In olden days, agricultural labourers were usually engaged by the year and, in the absence of such up-to-date facilities as labour exchanges or cheap newspapers, it was the custom for agricultural labourers to attend at the hiring season at some recognised spot, such as the market place, where bargains were struck between would-be employers and those who were prepared to enter their service. The dividing line between rich and poor was more strongly marked than at the present time, when the middle classes have grown in wealth and numbers, and when in consequence the enjoyment of a private garden is within the reach of the many, rather than the few. In ancient times, of course, the science of horticulture was comparatively in its infancy and, if the garden needed to be "tidied up" or the trees to be pruned, it was doubtless quite in the ordinary course of events for an agricultural labourer to be borrowed temporarily from the field or the orchard and instructed to execute a few simple jobs in his employer's garden.

On large estates, however, the luxury of a head gardener was indulged in, and the question which arose for discussion in the case of Nowlan *v.* Ablett mentioned above, ultimately turned on whether the head gardener was in fact entitled to regard his engagement as being by the year in the same way as if he had been an agricultural labourer or whether he should be treated as being rather in the nature of a member of his employer's household, and accordingly entitled only to one month's notice in the same way as if he were a footman or other domestic servant.

In the latter case he would technically be regarded as a "menial servant" and the discussion in Court as to the precise meaning of the term "menial" furnishes an interesting example of the manner in which words may change their meaning in the course of time. In the present day, the word "menial" is often used to describe work of a somewhat unintelligent, if not degrading, nature, but in past centuries that was by no means the sense in which the word was used. The Latin for the walls of a house is "mœnia," and accordingly a menial servant was one who was employed "within the walls" of his master's house. Any household servant was therefore a menial servant, irrespective of the nature of his duties, so long as he lived within the curtilage of the employer's residence. In Cowell's Law dictionary, published in ancient days, the following reference appears:

> "By 2 Henry IV. cap. 7. The giving of liveries is prohibited save that the king shall give only his honourable liveries to his Lords Temporal who shall please him and also to his knights and esquires *menial* and which be of his retinue and do take of him their yearly fee for term of life."

In an old Act of Parliament known as 2 Henry IV. cap. 21, it is enacted that "the Prince may give his honourable livery (a swan) to his menial gentlemen (Maynalx Gentilx)."

It will be seen, therefore, that there is nothing derogatory in the description "menial," and that it was not unreasonable to regard a head-gardener, living within the curtilage of his employer's house, as a menial servant. In the case referred to above, the Court held on appeal that Nowlan was entitled to a month's notice only, Lord Abinger the Presiding Judge saying:

> "I should have been inclined to have told the jury that the plaintiff was a menial servant, for though he did not live in the defendant's house or within the curtilage (intra mœnia) he lived in the grounds within the domain."

Another report states that the Judge added:

> "He was certainly employed for the service of the house."

(It might be well for private employers to consider whether a head gardener with a large staff under him should not be offered three months' notice in view of the limited number of situations of this nature available at any given moment).

The above case, however, throws no light on the position of under-gardeners. Are they also to be regarded as being in the service of the house, and accordingly equally entitled with a head gardener to a month's notice as a "menial servant," or is their position rather that of agricultural labourers entitled to such notice as the custom of the country or of their locality may sanction? The question is not one which can be answered with safety pending a decision of the High Court. It is true that under-gardeners are not usually provided with a cottage in the vicinity of their employer's house, but on the other hand they are certainly "employed in the service of the house," inasmuch as they are engaged in the cultivation of a garden which adds to the amenities of a house, and which is usually in close proximity to it. There appears to be a general impression in the public mind that possibly an under-gardener may not be entitled to more than a week's notice, but it would be a gross anomaly if a man who is frequently more or less skilled in the difficult science or horticulture were held not to be entitled to at least as long a notice of dismissal as a scullery maid. It is satisfactory to find that there are at least two recorded decisions of County Court Judges in this direction, although, as explained above, the Judge of a County Court cannot make law by his decision in the same way as a Judge of the High Court can do. In a case reported in *The Gardeners Chronicle* of March 6, 1909, the Judge of the Bath County Court held that a single gardener, who also looked after a couple of cows and did a little work in the house, was entitled to a month's notice. It may perhaps be contended that in this case the gardener was not an under-gardener, but on the other hand, neither was he a head gardener, as he was apparently at the head of no one but himself. Again on June 10, 1911, the Judge of the Salford County Court supported the view that gardeners were entitled to a month's notice, and not merely to one week's notice as claimed by the employer. Unfortunately, however, the accounts contributed by the local reporters were very meagre, and they did not even state whether the gardeners in these cases resided on their employer's premises. If necessary, however, further information could doubtless be obtained from the Registrar of the County Courts in question, though possibly this might entail some little expense.

In this connection, the facts in another somewhat ancient case, decided in the year 1841, may be of interest. One Johnson sued his employer Blenkinsopp under the following circumstances:

Plaintiff was engaged to act as gardener on the following terms, namely: To receive wages of 6s. a week in addition to 3 bolls of wheat, as well as the right to set Potatos for his family's use and to have a cow kept on his employer's premises, also to keep a pig but not poultry. He was also entitled to the free use of a house and firing. His duties were to keep the garden and pleasure grounds clean and in good order, to assist in the stables and, when required, to assist at the hay and corn harvests as well as to make himself generally useful. The point which arose in the case was whether his written agreement for employment could be put in evidence without being stamped as an agreement. It was admitted that if he were either a labourer or a menial servant then a stamp would not be required. Mr. Justice Pattison considered that Johnson was even more a menial servant than Nowlan, and Mr. Justice Williams added:

> "It is difficult to draw any line which may ascertain how much of house service makes a menial servant, but in this case the plaintiff is such a servant."

It was therefore held that the plaintiff was entitled to a month's notice and was not a yearly servant as had been claimed.

In 1893, the question of what is a menial servant again came before the Court in the case of Pearce *v.* Lansdowne. Mr. Justice Collins then held that "A menial servant denotes those persons whose main duty is to do actual bodily work as servants for the personal comfort, convenience or luxury of the master, his family and his guests, and who for this purpose become part of the master's residential or quasi-residential establishment." Incidentally, it may be interesting to the scholarly to note that his lordship expressed the opinion that the word "menial" came from the Saxon word "meiny" or "mesnie," meaning household or family, rather than from the Latin word "mœnia."

A menial servant is not necessarily a domestic servant. In the case of Toms *v.* Hammond decided in 1734, it was said that "A menial servant may be employed out of the house on household affairs, a domestic in or about the house only."

Surely, therefore, under-gardeners as well as head gardeners might reasonably ask for a month's notice before dismissal.

A natural enquiry which will probably occur to the reader is whether there is any distinction between the notice which a gardener is entitled to, according to whether he is employed on a private estate or in a nursery carried on in the way of business. The writer has been unable to find any reported decision bearing on this point, but it seems clear that a gardener would find greater difficulty in proving his right to be considered as a menial servant when working on a nursery than he would do if he were working for a private employer. The answer to this question is probably that the matter is one of the general custom of the Trade. In this connection it must be borne in mind that, in order to prove the existence of a general custom, the party on whom the onus of proof lies must be prepared to show not only that the custom is a general one, but also that it is reasonable. This furnishes an

additional reason why there should be a clear understanding on the subject of notice between employer and employed when a contract for service in nursery grounds is entered into.

Enough has perhaps been said to show generally what are the principles which would guide the Court in considering the facts of any particular case. One popular fallacy should, however, be borne in mind. There is a wide impression amongst a considerable section of the public that the length of notice to be given on dismissal turns upon whether wages are paid weekly, monthly or quarterly. This may be one of the elements to be considered in coming to a decision as to what would be reasonable notice, in the absence of evidence either as to specific agreement or custom, but it is not necessarily conclusive. A head gardener entitled to a month's notice, for instance, might still prefer his wages weekly for the sake of convenience, and he would not necessarily be deprived of his right to a month's notice merely on the ground of such an arrangement having been made. *H. M. V.*

THE UNSTERBERG PEAR TREE.

ONE of the many instances in which plants are associated with the fortunes of persons and places, is connected with an ancient Pear tree which has been growing for many generations at the foot of the Unsterberg, near Salzburg. Its periods of fertility are said to correspond with the fortunes of the Hohenzollerns. With their prosperity the tree flourishes and bears abundantly. When their star is no longer in the ascendant the tree looks as though it had been subjected to the smoke and heat of a bonfire. Thus in 1806, when the Rhine Confederation was founded and the Emperor abdicated, the Pear tree of the Unsterberg shrivelled and appeared dead; until 1871, when the tree put forth blossoms and leaves and bore fruit, which it has been said to have done unremittingly during the ascendency of the modern German Empire. This was told me some years since by the Director of a botanical institution in Germany; he also said that a branch of the Pear tree was preserved in the Hohenzollern Museum at Berlin. Whether the fall of the Hohenzollerns proves to be temporary or otherwise, time alone will show; but their fortunes are under such an unmistakably heavy cloud, that it would be interesting to know the condition of the ancient Pear tree.

There might be some means of ascertaining, perhaps through some lover of plant lore in the Army of Occupation, or one of those whose business takes them into the country.

This Pear tree is the same to which the Poet Chamisso alludes in one of his poems.

The subject is certainly one of interest to the lovers of plant lore. *E. Willmott.*

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

"The Two Tulip Trees" (see p. 128).—*W. J. B.* has omitted to mention the quickest way to enable anyone to distinguish between the Chinese and American species. In the latter the little horn which terminates the midrib at the top of the leaf is a noticeable feature, and is quite absent in the other, the midrib not extending beyond the blade. This is a far safer guide than shallow or deep lobes, which vary much on different trees and on different leaves of the same trees. I have grown both species for 10 or 12 years, and the general appearance of the foliage of the two trees is very much the same. The drawings of the two leaves in your paper of to-day would suggest that anyone could tell at a glance which species he was looking at. This, however, in real life is far from being the case. *Vicary Gibbs.*

Gardeners' Victory Memorial (see p.p. 115, 129).—The remarks of Mr. A. Cranston are of great interest, and I am at one with him when he suggests, as a national memorial amongst the horticultural circles of the community, the establishing of a large reserve in connection with the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, and I should be pleased not only to forward my "mite," but also to do everything that lay in my power to further this splendid suggestion. I wish, however, to point out that the placing of a tablet containing the names of fallen men on one of the garden walls, would serve to perpetuate the memory of our glorious dead, and especially those with whom we were in constant touch in our daily work. Even though estates change hands, and men come and go, surely the heroes' names should be emblazoned in our memories for ever. I would urge that the wall selected be an outside one, and not one within a bothy, for those brave lads went from all departments of our gardens. I already know of some who, like ourselves here, intend to adopt this form of memorial. *Edwin Beckett.*

The Recent Severe Weather (see p. 115, 129).—The records of frost given by C. J. (Ampthill) and Mr. Edwin Beckett, from February 8 to 14 inclusive, are much the same as were recorded here. The readings were 23°, 30°, 19°, 19°, 13°, 26°, 16° respectively. All plants of the Brassica family, with the exception of Spring Cabbage, were killed outright. The heavy fall of snow doubtless saved the cabbages from the same fate, as it well covered them. Ceanothus Veitchianus on a wall suffered badly, also Berberis Knightii, Olearia Haastii and Viburnum Tinus (Laurustinus) in the open. Even the common Laurel and Privet were "scorched" as by fire. Roses suffered badly. A fine old standard tree of La France variety, which has stood at least 20 winters, will fail to grow again. I agree with the remarks of Mr. R. W. Thatcher (p. 129) as to late Savoys proving their usefulness in a cold season. I intend to rely largely on this vegetable in the future. My experience is that where the ground is heavy, as is the case here, it does not do to plant Broccoli, Kale, etc., largely. *T. W. Stanton.*

The Frog-Hopper or Cuckoo-Spit.—Well may your correspondent, *K. Ashley* (p. 122), write concerning this pest: "Nothing save the most careful personal attention, constantly exercised, can deter this insect from its destructive course." In my small suburban garden to the south-west of London it is far and away the greatest pest that I have to deal with during the summer. Nothing—either flower, vegetable, or shrub—keeps free from it, as they are all alike dotted over with disgusting froth-like masses. In this neighbourhood the pests abound on the Privet hedges, so frequently met with in suburban districts, while they also occur on the grasses and weeds generally. Being so numerous, as fast as they are destroyed in one particular spot, others make their appearance in quantity. Paraffin emulsion is perhaps as effectual a remedy as any, but it is necessary to syringe it on with considerable force in order to wash away the froth, and get at the insect itself. This pest cannot be as bad in many districts as it is here, otherwise it would be more generally referred to in horticultural journals. The life history as detailed by your correspondent is particularly interesting. *W. T.*

Gardeners' Wages and Hours (see p. 128).—The letter signed *W. W.* in your last issue—coming, as I presume it does, from a master of his profession—seems to me likely to cause a great injury to men who do not realise any more than he seems to do that the inevitable laws of supply and demand will determine this question. No union can force employers to employ its members at all, or to pay them more than they can afford to pay, for what is in a great many places more of a luxury than a necessity; and, judging from the advertisement columns in your paper, there are many more gardeners who want places than there are places vacant. I believe that when private employers can choose between members of a trade union and free men, they will in nine cases out of ten prefer the free man. The war has taught us that we can do without many things which we had before, and be just as happy without them. With income tax at 6s. in the pound, and super-tax in addition, very few owners of large gardens will be able to spend as much as before on their gardens. It is also certain that the price of coal will keep many forcing houses and plant-houses closed; and if wages continue at their present rate, it will simply mean that fewer gardeners can be employed in private and in Government establishments. For men with pleasant manners (which are much more important to a gardener than to most artisans), a real love of his work (without which no one should enter the profession), and a competant knowledge of the work, coupled with industry and steadiness, there will never be any lack of situations which, if not so highly paid as *W. W.* thinks they ought to be, have at least the advantage of being the most healthy of all known occupations—if one can judge from the great age to which most country gardeners remain active and able to do their work. But there are, unfortunately, a number of men who either have not the brains or ability to do skilled work, but who think they are entitled to the wages of skilled men, and these are just the ones to be carried away by bad advice from those who ought to know better. I really do not understand what *W. W.* means when he talks of the "millions of acres that are wasted on empty display in the form of parks, pleasure-grounds, and such-like private enclosures," or at whose expense they are to be "cultivated on intensive principles to the enrichment of the country." Such clap-trap as this might do in Glasgow or South Wales, but will not appeal to the gardeners of Great Britain—who, if I may judge from a very wide acquaintance amongst them, are as a rule not inclined to Socialism, and prefer to be treated as they are by a great majority of their employers, in the friendly spirit of consideration which prevails in this industry to a greater extent than in any other. Another point which *W. W.* seems to forget is that there are in most country places a considerable number of old men, boys and women not strong or capable enough to earn full wages, or even to do a whole day's work, but who, under the direction of one skilled gardener—or even of an employer who loves his garden, as many do—are able and willing to perform a great deal of the work, without regard to fixed hours. Though we may not be able to teach them such luxuries as Orchid-growing, such willing helpers as these will not be turned out of their places to please any trade union, as they are in an engineer's or shipbuilding yard; and the sooner gardeners who are discontented with their pay and prospects recognise this fact, the better for themselves. To such men—and especially to *W. W.*—I commend that charming little poem by Rudyard Kipling, *The Glory of the Garden* (one of twenty poems published at 1s. by Methuen). This wonderful poem ought to be printed on card and hung in every bothy and potting-shed, for the benefit of young and old. *H. J. Elwes, Colesborne.*

——Why does Mr. W. Chivers, of Leeds, spoil his case by including such a recommendation as the payment of full wages at the age of 18? Not one boy in a hundred is adult in either brain or muscle at that age, and consequently cannot *earn* full wages; so that the result of the clause in the Corn Production Act is bad for both employer and employed. Boys are being discharged when they come to the age of 18, which is bad for them, and in a few years' time employers will suffer from a lack of properly-trained men. Just a sample of how the thing works: three days ago my foreman told me that a smart-looking lad had called during my absence, seeking work. He asked him how old he was, at which his face fell, and he answered "eighteen," adding that was the reason he had been turned off, and that he had been to four places that day after employment, only to be told he could not possibly earn 35s., so could not be taken on. In another case a boy was turned away from his employment when reaching 18, nearly a year ago, has not had a day's employment since and has been helping his parents at home. What will the effect be upon the young fellows who come under this law? The sooner this idiotic clause is cancelled the better it will be for all concerned. *Chas. E. Pearson, Lowdham.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

MARCH 11.—*Present:* Mr. E. A. Bowles (in the chair), Dr. W. Bateson, Messrs. G. Wilson, W. C. Worsdell, W. Hales, and F. J. Chittenden (hon. sec).

Odontoglossum × aspersum.—Mr. G. WILSON showed several early drawings of the plant known as O. Humeanum and the alleged parents, and of O. aspersum and its parents.

Variations from Root Cuttings of Bouvardia. —Dr. BATESON exhibited drawings of Bouvardia "Bridesmaid," and of the plant raised from it bearing double flowers similar to the variety "Hogarth," exhibited at the meeting of the Committee in January, 1916. He now showed drawings of a single form, raised from a root cutting of the form like "Hogarth," dissimilar to any cultivated at Merton. He also showed drawings of a Regal Pelargonium with another of a plant raised as a root cutting from it having flowers many shades deeper than the parent. Mr. Bowles said that he had met with a case of such variation in Anchusa italica. A white variety appeared, and on attempts being made to propagate it by root cuttings all (or most of) the plants came blue.

Seedlings of Myosotis Pride of Zurich.—Dr. BATESON said that seedlings of the Myosotis form known as "Pride of Zurich," in which the petals have a white stripe down the centre, when the seed was obtained under protection from insect pollination all gave white flowers. The seedlings from plants raised in the open have either blue or white flowers, not striped ones. In one case a blue flowered seedling bore a branch producing white flowers with a blue central stripe unlike anything before met with. The production of white flowered seedlings suggested that the ovules were produced from the portion of the carpel corresponding with the white central stripe in Myosotis "Pride of Zurich."

Crocus with markings of outer like those of inner segments.—Mr. BOWLES showed a Crocus having some of the outer segments without the feathered markings like those of the inner, one flower so differing had occurred on the same parent corn with a normally coloured one. Others had a portion of one of the outer segments half within the others and unfeathered, the other half, which had been exposed, being feathered.

Galanthus nivalis green tipped.—Mr. BOWLES also showed a fine flower of Galanthus nivalis with a green tip to the outer segments. Such forms appear to occur in all the species of Galanthus and are usually associated with a malformed spathe.

LINNEAN SOCIETY OF LONDON.

General Meeting.

MARCH 20.—Sir David Prain presided at the Annual General Meeting, and, after the election of nine new Fellows, he read the proposed alterations in the Bye-Laws for the third time, and again explained the reasons which induced the Council to prepare these proposals. He was followed by the Treasurer, who showed that the adoption of these proposals would be advantageous from the financial point of view; and further stated that the number of Fellows was at that moment 702.

Two ballot-boxes were used, and the proposed alterations were separately voted for by chapters, and adopted as follows :—

The first section of Chapter I. and the second Section of Chapter VIII. to be repealed, and the following substituted :—

CHAPTER I. Section I.—The number of Fellows shall be limited to Seven hundred and Ten, exclusive of Honorary Members, Foreign Members, and Associates. The method of Election shall be by Ballot.

CHAPTER VIII, Section II.—The Council for the time being shall, before the day of Election, prepare Balloting Papers with lists of the Persons whom they recommend to the Society to be elected as Council and Officers for the ensuing year.

Dr. Harold Wager, F.R.S., F.L.S., then delivered a lecture, entitled, "On the Colour-sense of Wasps."

SCOTTISH HORTICULTURAL.

MARCH 4.—The monthly meeting of this Association was held at 5, St. Andrew Square, Edinburgh, on this date, Mr. Fife, president, in the chair.

A paper was read by Mr. GEORGE W. TAYLOR, Edinburgh, on "Plant Breeding and the State." Mr. Taylor briefly outlined the scheme which was proposed for the establishment of a plant breeding station in Scotland, and severely criticised the spending of public money on such an institution. State endowment was not wanted; what was wanted was a fair field and no favour, and he pleaded for the encouragement of the individual of the right type, who must get encouragement if progress was to be made. But the proposed station held out no prospect of this. By advocating the system of premiums they would harness the best brains of the country, and they would promote competition and would thus get progress, and it was to be hoped that those premiums would yet be forthcoming.

Mr. P. MURRAY THOMPSON, Cockhill House, Mealsgate, Cumberland, exhibited 20 species and varieties of Galanthus.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

MARCH 13.—The attendance at the annual meeting, held at the Royal Horticultural Hall on this date, was not large, but it was better than in the immediately preceding years. Mr. Chas. H. Curtis presided, and moved the adoption of the Report, which showed that the Society was in an excellent financial position and continues the excellent work for which it was instituted. Very many of the members joined his Majesty's forces during the period of the war, and no fewer than one hundred have lost their lives in the great contest. During the year 1918 the Committee invested £2,000 in War Loan, thus bringing their holding of War Stock to £7,500 and the total invested funds to £54,000. The Chairman pointed out that the Juvenile Section had not made much progress, but he expressed the hope that now so many gardeners had returned to their duties the garden lads would be induced to join the Society. He also referred to the advertisements the Committee was publishing in the Horticultural Press, and said that from the one in *The Gardeners Chronicle* no fewer than sixty inquiries had been received. The reports and accounts of both Ordinary and State Sections were adopted.

The retiring members of the Committee were re-elected, and Mr. Sargent and Mr. Bashford were appointed to fill vacancies. Messrs. Gunner and Puzey were re-appointed auditors, and Mr. T. Winter and Mr. A. C. Hill were re-appointed treasurer and secretary respectively, the latter being granted £50 for special work conducted under exceptional circumstances during the war period. The Trustees and the Horticultural Press were thanked for services rendered, and a vote of thanks was passed to the Officers and Committee.

An interesting discussion, raised by Mr. WINTER, followed the general business, and took the form of suggestions for further advertising the aims and objects of the Society. Messrs. BUTLER, BARTLETT, HOWARD, OXTOBY, NORTH and others took part, and eventually it was agreed that so far as possible the Society should be represented at leading shows, take advantage of mutual improvement societies' meetings and issue a leaflet setting forth the special advantages of membership.—At a subsequent meeting of the Committee Mr. C. H. Curtis was re-elected chairman for the eighteenth consecutive year, and Mr. Bedford vice-chairman.

TRADE NOTES.

THE recent activities of the Chamber of Horticulture give a clear exposition of its policy in regard to linking up. That policy was defined as one of not interfering with the work of any particular section, but using its influence and force to strengthen each section so as to in turn strengthen itself.

The following matters have been engaging the immediate attention of the Chamber :—

(1) *Manures.* A Manures and Fertilisers' Section having been formed, the attention of the Chamber was called to the need of some amendment being obtained, if possible, in the Compound Fertiliser Order of June 4th, 1918, under which Order it was felt by the manufacturers of compound fertilisers impossible for them to do justice to the growers by supplying a fertiliser at the unit price which should contain the desired organic constituents. The Chamber immediately convened a meeting of the section to which this matter properly belonged, and as a result of the discussion which took place an informal deputation to Dr. Keeble, of the Food Production Department, was arranged, the result being that Dr. Keeble sympathetically entered into the views of the members of the section and gave certain advice which will be followed by the Chamber and must tend to the benefit of the section which brought the matter forward. It is interesting to note that the feeling which has existed that the Chamber of Horticulture had a policy antagonistic to manufacturers of manures, is entirely dispelled by the proceedings of the conference, and the subsequent result which the section was able to obtain, backed up as it was by a prominent representative of the growers. The good attained by round-table conferences is emphasised in that as an outcome of the discussion growers and manure manufaturers went hand in hand, as it were, to the Government Department which could help them.

(2) *Insecticide Manufacturers' Section.* Here, again, the goodwill of manufacturers towards growers was brought into evidence by the section of the Chamber representing insecticides manufacturers asking the Organising Committee to arrange a conference with a view to establishing a standard for sprays. Recent articles in the Press have shown the necessity for some legislation alike in the interests of manufacturers and growers. The effect of the discussion which took place is that a sub-committee has been appointed to debate the desirability and practicability of establishing a standard for certain articles largely used in the composition of sprays. Government assistance will be called in through the medium of the Chamber, and co-operation established between departmental and private chemists which must be of lasting good.

Particulars of the discussion at these conferences may be obtained on application to the Secretary of the Chamber, at 11, Adam Street, Adelphi, W.C.2, the new temporary offices.

(3) The Chamber, having been approached to give assistance in the formation of Market Gardeners' Associations in Biggleswade and Cardiff, has undertaken the preliminary steps and organised public meetings in conjunction with the Market Gardeners, Nurserymen and Farmers' Association, to which these provincial associations will be affiliated. The Chamber does not derive direct benefit from its assistance, but hopes to make clear to the doubters that its policy is to help various sections of the Trade and to bring greater force to the arm which it hopes to wield on behalf of horticulture generally.

SOME time ago the British Florists' Federation took up the subject of flower and bulb exports from Guernsey, as somewhat severe restrictions were imposed last autumn, notwithstanding the fact that so far as flowers are concerned the Customs authorities had a general licence to admit fresh flowers from France and Holland. As a result of representations to various Government departments, an interview with the Home Office and Dr. Keeble's interest in the matter, the following communication has

been received by Mr. Chas. H. Curtis, sec. B.F.F.:

"Home Office, Whitehall, S.W.1.
March 14, 1919.

Sir,—With reference to your letter of the 8th ultimo, I am directed by the Secretary of State to say that the Guernsey Food Production Authority having given an assurance that no increase in the acreage of land now used for the cultivation of flowers will be permitted this year, he has authorised such a relaxation of the restrictions imposed by the Ordinance of the 30th September, 1918, as will permit of the free export, during the current year, of flowers and bulbs from Guernsey to the United Kingdom. The question will be reconsidered next year should it be thought necessary. *A. J. Eagleston.*"

CROPS AND STOCK ON THE HOME FARM.

Clover.

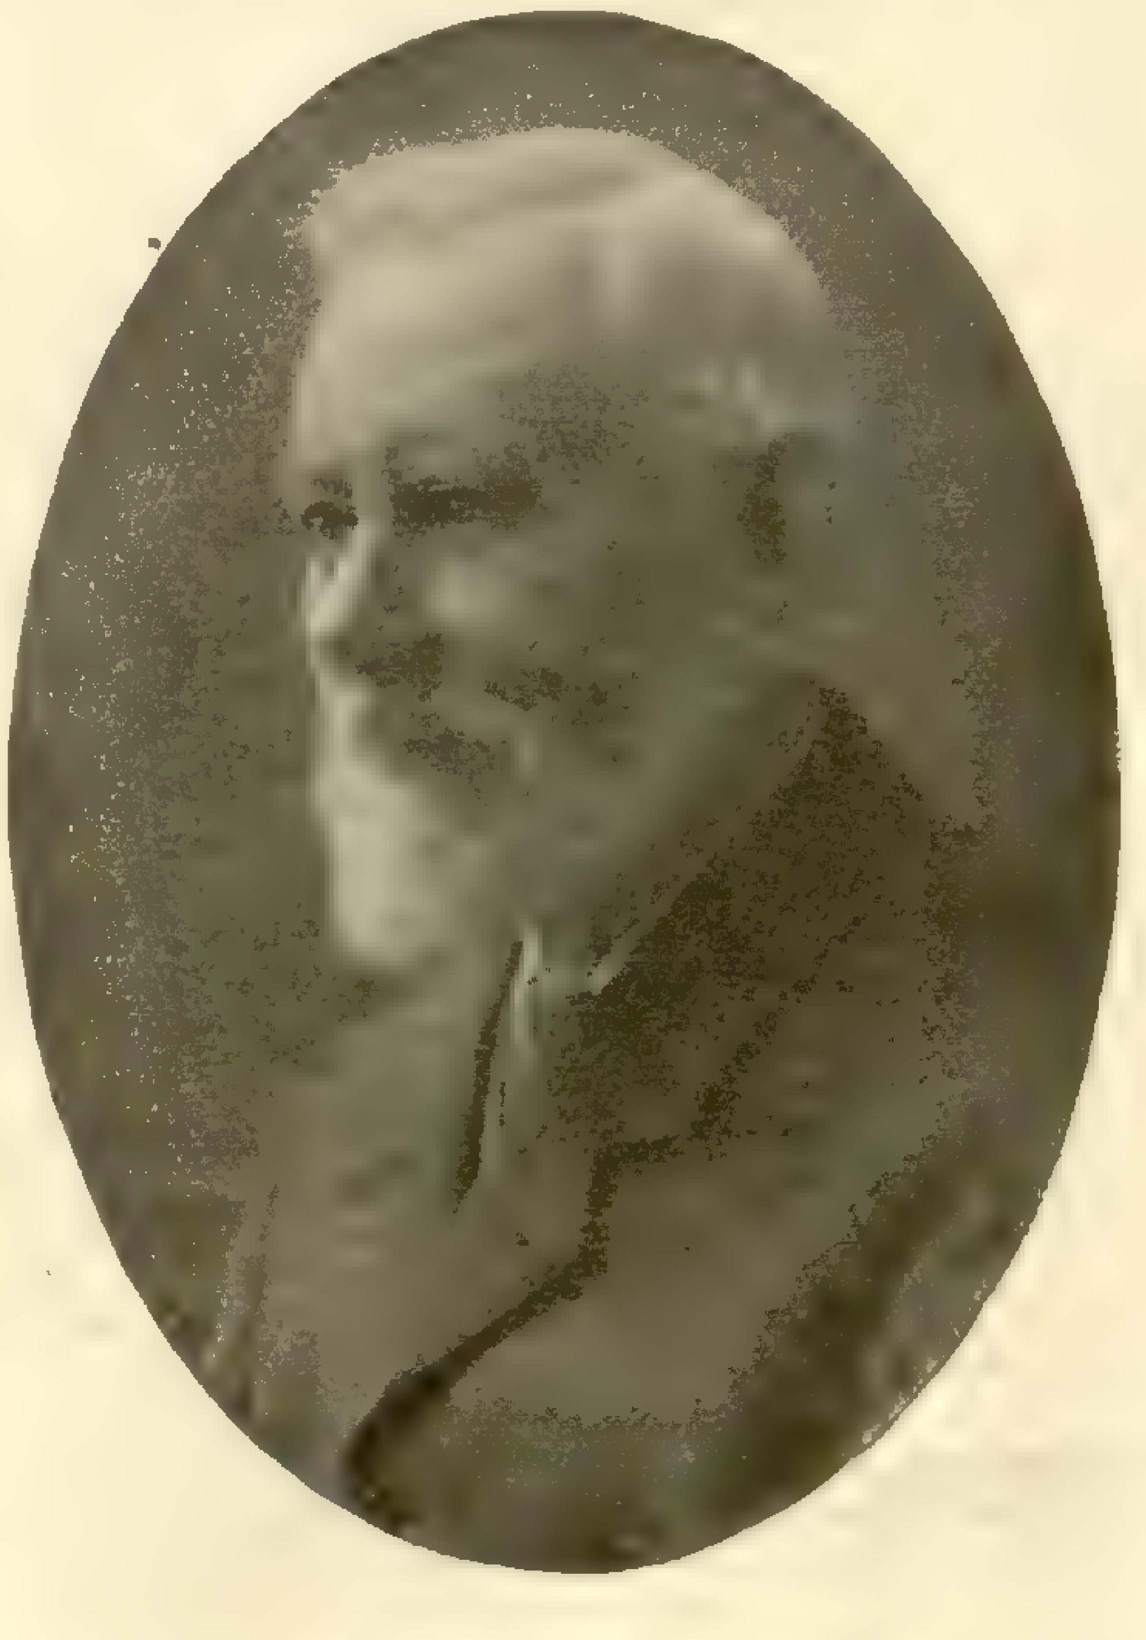
One of the most profitable crops grown on the farm is the Common Broad Clover (Trifolium pratense) where hay, Wheat seed or autumn feed is required for the sheep. Where hay alone is the main object, a mixture of Italian Rye-grass and Devon or Hampshire Bents is an advantage, as a greater bulk is obtained, while the hay is more appreciated by cattle, is more easily made and not so liable to suffer from adverse weather as does Clover alone, owing to its mass of woolly leaves, which hold the moisture more than the various grasses. Further, the grass is often the means of obtaining a crop when the Clover is poor.

Where a Corn crop is to follow Clover, as it usually does, with the exception of where the land lies wet during the winter, it is better to sow spring Oats, which are not so liable to suffer like Wheat sown in October. Italian Rye-grass is not a favourite preparation for Wheat, as it robs the Wheat plant of a large share of food. Bents, not being so vigorous or such gross feeders as Italian Rye-grass may be sown for a Wheat crop with greater safety.

Where the land is fairly dry during the winter, and Wheat is the principal crop, then only Clover should be sown, as it is usually conceded that the best Wheat crops are obtained after Clover. Amongst farmers this fact is generally known, but the cause is indifferently understood. The fact is that Clover, being a leguminous plant, it is able, by means of the bacteria housed in the nodules on its roots, to obtain free nitrogen from the air and render it available for the Wheat plant to follow. Where Clover only is grown the first cut is taken in June, often two tons per acre, and the second growth is fed by sheep folded on the land in September. The manurial dressing left is most beneficial to the Wheat or Oats which follow, especially if ploughed in at once instead of allowing the droppings to become dried up by long exposure to air. A well-grown crop of Clover, free from weeds, is often remunerative when the second cut is saved for seed, carefully harvested, and threshed but a good Wheat crop cannot be expected to follow if the sheep are not penned on the plot, and the plant is allowed to perfect and ripen seed. The remedy in such a case is to give either 6 cwt. of basic slag in the autumn, followed by 1¼ cwt. sulphate ammonia early in February, or farmyard manure in the autumn at the rate of 15 to 20 tons per acre. I have treated this subject rather fully because I realise what a valuable farm crop Clover is.

Other forms of Clover, such as Alsike (T. hybridum), White Dutch (T. repens), and Yellow Trefoil (T. procumbens) are useful in their several ways. The two former improve the feeding value of pastures. The last, mixed with Italian Rye-grass for an early cut of hay or sheep feed in May, when other foods are scarcce, is valuable. Some farmers sow 2 lbs. of Sainfoin per acre to increase the first season's crop of hay, but I do not approve of its use in that way because of overcrowding. The need for encouraging the growth of Alsike and White Dutch Clovers cannot be over-emphasised in pastures for sheep, cows, and young stock. Basic slag applied in the autumn, or a good dressing of farmyard manure, or a compost of roadside refuse, wood ashes and lime or fine chalk, will do much to increase the growth of the wild White Clover. Seed of Alsike should be sown in April at the rate of 6 lbs. per acre, thoroughly disturbing the surface soil with coarse harrows both before and after the seed is sown.

The method of sowing Broad Clover varies in different localities. Almost universally it is sown along with a cereal crop, but in the case of Oats and Barley the harrowing in of the cereal suffices for the Clover seed also. When sown with Wheat, as is frequently the case, the seed is usually sown the first week in April—earlier or later according to the condition of the soil, which should be dry for harrowing the Wheat and the more effectually to bury the Clover seed. It is the practice to harrow the land containing the Wheat crop in the spring, to accelerate growth, especially where the plant is "thin," by the admission of air, consequently the harrowing does double duty. The quantity of seed to sow per acre varies. Where the soil is well drained and the land fertile, I find 15 lbs. of Clover seed sufficient per acre. If grass is to be sown with the Clover to improve the bulk I use half a bushel of Italian Rye-grass or Bents.



THE LATE THOMAS NEVE.

The seed is sown by the aid of the hand seed-barrow, two of these being required if Clover and grass are sown, as the two kinds of seeds do not run well together from the same box. Some farmers do not harrow the soil after sowing the seed, but simply draw the roller over the whole. In a showery season this method may answer while germination is taking place, but should dry weather follow, as it often does in May, the seed is liable to "malt" and become useless.

The three enemies of Clover are Clover sickness, Dodder and impoverished soil, and all are remediable. The first is the more serious, especially where only a small area of arable land is available. Clover sickness is mainly the result of a too frequent use of Clover on the same land. Where Clover has to be grown more frequently measures should be taken to combat the Clover sickness, which is mainly the work of eelworms, which injure the stems. A dressing of gas lime at the rate of 2 tons per acre, spread on the land in the autumn before ploughing, should help to check this pest, or even ordinary lime would serve a useful purpose.

Dodder should not be present in clean Clover seed. Seedsmen knowing the injury done to Clover by this parasitic plant take great pains to remove all the seeds of the pest, which rapidly entwines itself around the Clover plants and spreads destruction all round.

As a rule the most vigorous and dense "plant" of Clover is found on the headland in every field, and the crop is often good there when other parts of the field are quite bare. This surely proves that Clover enjoys a firm rooting medium.

Obituary.

Thomas Neve.—We learn with sincere regret of the death on the 5th inst., at Wolvercote, near Oxford, after a very brief illness, of Mr. Thomas Neve, for over forty-three years head gardener at Sindlesham House, Wokingham. Mr. Neve, who had only retired into private life some ten months ago, was, previous to going to Sindlesham House, employed in the gardens at Wakehurst Place, Sussex, and was an active member of the Reading and District Gardeners' Mutual Improvement Association; and on his retirement was elected a life member of the association in recognition of his services. Some twenty years ago, when Mr. T. Turton left the neighbourhood of Reading, Mr. Neve took up the duties of honorary local secretary of the Royal Gardeners' Orphan Fund, to which institution he yearly rendered most valuable service, until a few months ago, and ever regarded the fund with deep affection. A good gardener, and a gentleman by nature, Mr. Neve enjoyed the esteem and regard of a wide circle of friends, and deep sympathy is felt by all with his family and only surviving brother, Mr. Albert Neve, proprietor of Hollamby's Nurseries, Groombridge.

ANSWERS TO CORRESPONDENTS.

Gardener's Notice to Leave: *R. R.* See article on A Gardener's Notice, p. 143.

Names of Plants: *G. Cooper.* No. 1 is Juniperus bermudiana (not hardy). The Yew is Taxus baccata var. aurea (Golden Yew). H. Cornus Mas.

Plum, Burbank's Giant Prune: *Notts.* This American Plum is a late flowering tree, and specimens grow splendidly in Kentish orchards. Trees should succeed quite well in your district, and you would be best advised to plant standards.

Roses, Rhubarb and Raspberries: *E. C.* (1) You cannot do better than clean the Maréchal Niel Rose stem with Gishurst compound, repeating the operation later if scale appears again. It is not safe to burn sulphur in any form in a house where there are plants with tender foliage; dust the leaves with dry sulphur if mildew appears. Prune the Rose tree in autumn or spring. (2) Cover the Rhubarb crowns first with pots or boxes, and then place the manure over and around these. (3) All Raspberry canes that have fruited should be cut away in autumn or early spring. From the description you give, yours must be autumn fruiting Raspberries, which fruit on the new current year's wood.

Yew Tree: *H. H.* You can cut back your Yew-trees at any time now before the end of April. Yews and Hollies of any age or size break freely from the old wood, and we should advise you to cut your trees back to the desired shape and size at once, as then they will break evenly all over and do much better than if the work is done piecemeal. It will take two, or perhaps three, years for them to become properly furnished again. After cutting back the shoots, give the roots a good surface dressing of stable manure, and see that they do not suffer from want of water during dry weather.

MARKETS.

COVENT GARDEN, March 18.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

— Victoria ...	12 0–15 0	Snowdrops, per doz. bun. ...	3 0– 4 0
— Princess ...	7 0– 9 0		
Freesia, white, per doz. bunches	4 0– 6 0	Tulips, per doz. blooms—	
Heather, white, per doz. bun.	6 0–10 0	— mauve ...	6 0– 8 0
		— white	6 0– 8 0
Lilac, white, per bunch, 6's ...	4 0– 6 0	— yellow... ...	5 0– 6 0
Lily-of-the-Valley, per bun. ...	5 0– 7 0	Violets, single, per doz. bun. ...	3 0– 6 0

REMARKS.—White blooms remain the chief attraction and supplies have been freer during the past week. Improved supplies have arrived from home growers consisting of Azaleas, Camellias, Carnations, Daffodils, Lily-of-the-Valley Narcissus ornatus, N. Grand Primo, Darwin Tulips, and an abundant supply of single Violets. The last are now in excellent condition. Roses are also increasing in number, General Jacqueminot can now be added to the list; prices are on the down grade. Orchids are a trifle more plentiful, especially Cattleyas, Cypripedium, Cymbidium, Odontoglossums, and a few blooms of red Odontiodas. French flowers show signs of the end of the season; many packages are almost unsaleable when they arrive, no doubt owing to the milder weather, and also possibly to delay in transit. Allium (Star) double white Stocks, Irises, and a few double Anemones still arrive in a fair condition. Consignments from the Channel Islands consist chiefly of Daffodils, White Narcissus, Violets, Freesia, but the supplies are very irregular and arrivals uncertain. A few hours delay in transit impairs the quality of these flowers considerably, especially Daffodils; they are unfit for transit again and have to be sold at low prices to clear.

Vegetables: Average Wholesale Prices.

Fruit: Average Wholesale Prices.

	s. d. s. d.		s. d. s. d.
Grapes:—		Nuts, con.—	
— Almerias, per barrel (about 3½ doz. lbs.)	70 0–100 0	—Cobnuts per lb.	1 8– 1 4
		Walnuts, kiln dried, per cwt.	90 0–200 0
— Gros Colmar, per lb. ...	8 0–11 0	Pears, Californian (Easter Beurré), cases containing 8 to 10 doz. per case	55 0 60 0
— Belgian per lb.	8 0– 8 0		
Nuts— — Almonds, per cwt.	110 0–112 0	—Winter Nelis, per case	80 0–85 0
— Barcelona, per cwt. ...	110 0 —	Strawberries, per lb.	25 0–35 0
— Brazils (new), per cwt. ...	85 0–90 0	Pineapples, each	5 0– 7 0

REMARKS.—There are still fairly good supplies of Gros Colmar grapes from home growers, and Belgian supplies of this variety are also available. Some good samples of Spanish Almeria grapes are also offered. A few forced Strawberrise arrive daily. Pineapples are fairly plentiful. Californian, Winter Nelis and Easter Beurré Pears continue to be available. A consignment of Tasmanian and Australian Apples is due shortly, and it is anticipated that the whole consignment will amount to 700,000 cases. The forced Vegetables available include Seakale, Cucumbers, Mushrooms, Beans, Potatos and Asparagus (English and Continental). Salads are fairly plentiful, but outdoor vegetables are limited in numbers as is usual at this season of the year.

GARDENING APPOINTMENTS.

Mr. H. Etheridge, 5½ years at Meldon Park, Morpeth, as Gardener to Mrs. Clayton, Rothley Crag, Hartburn, Morpeth, Northumberland.

SALES BY AUCTION.

HIGHLY IMPORTANT SALE OF ORCHIDS.

MESSRS. PROTHEROE & MORRIS have been favoured with instructions to dispose of the Wonderful Collection of ORCHIDS formed by the late

F. MENTEITH OGILVIE, Esq.,
of The Shrubbery, Oxford.

The Collection comprises about 9,000 Plants, and will be submitted to Auction on the premises as above, on

TUESDAY, APRIL 1 AND TWO FOLLOWING DAYS,
at 11 o'clock precisely each day.

The Collection contains many valuable plants of Odontoglossums, Odontiodas and Cattleyas, some of which have received first class certificates at the R.H.S. Meetings. Also Cattleya, Laelio-Cattleya Seedlings, and other cool, intermediate and hot house varieties.

The Catalogue is now ready, and may be obtained on the premises, and of the Auctioneers, 67 & 68, Cheapside, London, E.C.2.

WEDNESDAY NEXT.

Fruit Trees, Roses, Rhododendrons, Herbaceous Plants, Carnations, Bulbs, etc., at One o'clock.

Also

At FOUR O'CLOCK,

1,000 AZALEA INDICA, newly Imported Plants, well set with Bloom, together with 1,400 BEGONIAS, to Colour.

MESSRS. PROTHEROE & MORRIS will sell as above at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C.2, on

WEDNESDAY, APRIL 2nd, 1919.

Catalogues on application. Commissions executed.

ST. ALBANS, HERTS.

Within easy reach of St. Albans Railway Station (Midland Railway).

The Collection of Cool and Intermediate House Orchids, viz., Odontoglossums, Cypripediums, Cattleyas, etc.; also about 800 Polypodium Mandaidnum, including several extra large specimens, Asparagus elongatus, Plumosa and Sprengerii, Adiantums, Geraniums, Cactus, etc., together with the erections of 9 Greenhouses, 2,850ft. of 4-inch Hot Water Piping, 3 Boilers, Brickwork, Staging, Flower Pots, Roll Top Desk, Office Table, and sundries.

MESSRS. PROTHEROE & MORRIS have been instructed by Mr. B. SWAN to Sell the above by Auction on the premises.

THE KEYFIELD NURSERY, WATSON'S WALK,
ST. ALBANS,

On TUESDAY, APRIL 8th, 1919,

At 12 o'clock precisely.

May be viewed. Catalogues can be obtained on the premises; or of the Auctioneers and Valuers, 67 and 68, Cheapside, E.C.2.

The schedule can be obtained by application to
The REV. G. M. A. HEWETT,
The Warren,
Harestock, Winchester;
Or at the shops of Messrs. Hillier, Jeffery and Watts.

NOTICES.

JOHN PEED & SON beg to notify their customers and friends in the Midlands and North of England that Mr. R. GREENFIELD will resume his work as their representative in those districts early in April after more than two years' war work in the organising of food production for 12,000 munition workers at Coventry.

JOHN PEED & SON, the King's Seedsmen and Nurserymen, West Norwood, London.

THE UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY, established in 1865, has invested funds amounting to £54,800. It assists members during Sickness, Convalescence and Distress, and enables them to make some provision for old age. All Gardeners are invited to join the Society. Lads over 12 years of age are admitted to the Juvenile Branch.—Full particulars from A. C. HILL, Secretary, 35, Alexandra Road, West Kensington Park, W.14.

BUSINESS CARD.

BRITISH CORRESPONDENCE SCHOOL OF HORTICULTURE, PENNINGTONS, 254, Oxford Road, Manchester.—Complete courses for R.H.S. Senior, Junior, Teachers', and National Diploma of Horticultural Examinations. Fees moderate.—Write, SECRETARY.

FERNS AND FERN CULTURE.

By J. BIRKENHEAD, F.R.H.S.
Revised by F. PARSONS.

THIRD EDITION.

This useful volume, thoroughly revised and with abundance of useful and beautiful illustrations, forms the fern-lover's *vade mecum*. Besides dealing exhaustively with the cultivation of ferns, and indicating those suitable for every possible set of conditions, it contains full directions for the prevention and eradication of insect pests.

The work is excellently printed on best quality paper, and well bound in cloth.

PRICE ONE SHILLING, or 1/3 Post Free.

PEACE!

WITH the near approach of the Peace Settlement the paper problem becomes less acute, and we are now in a position to accept more advertisements than hitherto. We shall be glad if our clients will send us their orders for a series NOW, in order that we may allocate the space. In order to prevent disappointment, those who wish for special positions will be well advised to secure them at once.

Please address all communications to;

What About
'BETTER CROPS' SEEDS
for Your Garden?

We could not improve the cropping powers of TOOGOOD'S GUARANTEED GARDEN SEEDS, so we have FURTHER improved their QUALITY. They mean a Better Garden than you have ever had before. More and BETTER QUALITY VEGETABLES—more appetising in appearance, sweeter and more succulent, free from bitterness, stringiness, and other undesirable characteristics, and POSSESSING THE PECULIARLY PLEASANT FLAVOURS OF PERFECT VEGETABLES. They mean AN INEXHAUSTIBLE WEALTH OF LOVELY FLOWERS, making that Garden of yours as gay and as lovely all the year round as the one you have so often admired.

AND THEY COST NO MORE THAN ORDINARY, UNGUARANTEED GARDEN SEEDS TO BUY.

Get the Free Guides.

(1) TOOGOOD'S FREE GUIDE TO GARDEN WISDOM AND GUARANTEED VEGETABLE SEEDS, and (2) TOOGOOD'S FREE GUIDE TO GUARANTEED FLOWER SEEDS. Send a post-card for them to-day. Beautifully illustrated, and indispensable for YOUR Garden. EVERY packet of Seeds, too, ordered thence MUST grow for you and please you or you will get it REPLACED FREELY. No obligation of any sort. SOME LITTLE KNOWN BOTANISTS.

IN going through Musgrave's *Obituary* for the names of such gardeners and others connected with horticulture whose deaths up to the end of the 18th century are there recorded, for the article published in *The Gardeners' Chronicle*, December 14, 1917, I extended the scope of my notes, and included botanists, with. I think, some interesting results. In the 17th and 18th centuries a botanist of any note was nearly always a medical man. In view of the very large part which in those days herbs played in the composition of medicines, this was not surprising. A knowledge of the properties of herbs was a very important part of a medical man's curriculum, and whilst the majority may have been content with a utilitarian acquaintance with botany, others entered into the science with enthusiasm, and became distinguished ornaments of it. Even in modern times it would be easy to make up a long list of men who abandoned the profession of medicine for the science of botany, and perhaps no more conspicuous an instance could be mentioned than the late Dr. M. T. Masters.

It will, therefore, be readily understood how it is that the term botanist was, until about a century ago, almost always synonymous with medicine, though we find it sometimes applied to such amateur gardeners as Evelyn. But while nearly all botanists practised medicine, the number of doctors who became eminent botanists can hardly be described as large. Very few escaped the wide net thrown by Mr. James Britten and Professor Boulger in their admirable *Biographical Index of British and Irish Botanists*, 1893, and its three supplements, bringing the work up to 1902, and of which an entirely new edition is much wanted. They have indeed left very little for those who come after them. And if those who fish in shallow streams cannot expect to land big catches, their joy is none the less justified by the occasional netting of a few small sprats! But I think that at least one of the men I have rescued from oblivion is much too important to be included among the small fry. I think, indeed, he may be regarded as a very important person in the history of 18th century botany. I refer to Dr. Thomas Clarke, who is a very prominent figure in the history of Jamaica, for he was His Majesty's Botanist of that island, and the first to hold that appointment. He arrived in the island in 1774, at the particular instance and request of Sir Basil Keith. Mr. Frank Cundall, Secretary of the Institute of Jamaica, and the author of *Historic Jamaica*, tells me that Dr. Clarke obtained the Akee, a very popular fruit (eaten as a vegetable) in Jamaica, from a West African slave ship in 1778. The first public garden established in the Island was the old Botanic Garden, at Bath, and in the Journals of the House of Assembly mention is made of Dr. Thomas Clarke, "Practitioner in Physic and Surgery," to superintend two Botanic Gardens then intended to be established in the Island. One was to be a European garden, which, however, was not established till long after at Cinchona, and the other was the Tropical Garden at Bath. Dr. Clarke, according to Mr. Cundall's *Historic Jamaica*, 1915, on his arrival on the Island, brought with him the Jujube tree (Zizyphus Jujuba), the Litchi (Euphoria or Nephelium Litchi, from China), the purple Dracaena, the Sago Palm, and the valuable Camphor tree; so that it is reasonable to assume that he came, not direct from England, but from some other colony, perhaps from the East Indies. A fairly full record of Dr. Clarke's activity as a botanist and as a benefactor to the Island may be found in the "Hortus Eastensis," which Dr. Arthur Broughton contributed to Bryan Edwards' *History, Civil and Commercial, of the West Indies*. Vol. III., pp. 367-407. My edition is the fifth, issued in 1819, so that the references may not be exactly applicable to the other editions. Very large numbers of exotics are registered there as being introduced by Dr. Clarke, and in most cases the date of introduction is given as 1775. These include plants from the East Indies, Cape of Good Hope, China and Japan, Africa, Peru, Egypt, and Carolina, so that the problem of Dr. Clarke's residence prior to his settling in Jamaica is not easily solved. Dr. Clarke died in February, 1792, and a brief obituary notice appeared in the *European Magazine* of that year (p. 239). There were other botanists connected with Jamaica of whom it would be interesting to have fuller details, notably, M. Wallen, a friend of Swartz, who introduced the first plants of the Watercress and the Bamboo. Wallen, however, appears in Messrs. Britten and Boulger's *Index* (the date of his death has not been traced), but Dr. Thomas Clarke does not.

One of the earliest names, in point of date, extracted from Musgrave is that of "Sands," who is described as of Wadham College, Oxford, and Professor of Botany. This undoubtedly refers to Edwin Sandys, who is recorded by Messrs. Britten and Boulger in their first Supplement, and is noticed by Dr. J. R. Green in his *History of Botany*, 1914, in Foster's *Alumni Oxonienses*, and in Pointer's *Oxoniensis Academia*, 1749 (p. 250). He was Sherardian Professor of Botany, 1720-4, and Fellow of Wadham from 1713 until 1731, when he probably died. Another Oxford man, Dr. John Robinson (1650-1723), Bishop of London, claims notice, not so much perhaps on account of his being a botanist, as from the fact that he was a benefactor of the Physic Garden at that seat of learning.

Another man who combined the twofold functions of medicine and botany, and is unrecorded by Messrs. Britten and Boulger, was Charles Chemys, one of the Fellows of the College of Physicians, and Professor of Botany at Trinity College, Dublin (Scholar, 1718; B.A., 1720; M.B., 1724; ; and M.A., 1727). He died in Dublin, September 9, 1733, but does not appear to have made any contribution to botanical literature. From the *Gentleman's Magazine* we learn of the death. on January 21, 1733, aged 95, of a Dr. Moze, "a learned antiquary and botanist," whom I have failed to identify; perhaps the name was Mose, and he may have been the Henry Mose who "augmented" James Hodder's *Arithmetic*, 1683, a work which passed through many editions. There was a Sussex family of this name.

I bracket together, two contemporary medical men who, if they are not known as botanists, were probably deeply versed in the knowledge of the properties of plants. Of them very little information appears to be available. Dr. Benjamin Fleeming, who died on January 8, 1734, was "famous for his bitter tincture"; and Dr. John Tennant, who died October 27, 1748, discovered the virtues of the Rattlesnake Root (probably Polygala Senega). Tennant was a Scotch physician in Virginia. The Indians used the root as a remedy for the sting of the rattlesnake, and Tennant considered that it might be administered in cases of pleurisy and peripneumonia. He communicated his observations to Dr. Mead (1673-1754), the famous London physician and art collector, and these were published in the form of an Epistle, with an engraving of the plant. Tennant's practice was to administer the root in powder or as a strong decoction, and more often infused with wine.

Dr. Thomas Brisbane, who died early in 1742, was Professor of Botany and Anatomy at Glasgow, but Dr. Green (*History of Botany*, p. 189) notes that his teaching of botany did not do him much credit. Yet another man who combined medicine and botany was Dr. James Newton, who died at the age of 78, on November 5, 1750; he kept a private asylum near the Islington turnpike, and his claim to rank as a botanist may not be great, but Musgrave, who described him as a "botanist and medic," may have had further details about him than what appeared in the *Gentleman's Magazine* in 1750. Although described as a "celebrated botanist," Dr. John Wodrow, a Glasgow medical man, who died December 12, 1768, is not mentioned by Messrs. Britten and Boulger, nor by Dr. Green. He was the son of a minister (perhaps Robert Wodrow, the ecclesiastical historian), and may be identical with the man of the same name who translated Ossian's Poems. Dr. Thomas Hamilton, who died January 7, 1782, was Emeritus Professor of Anatomy and Botany at Glasgow and is mentioned by Green, who, however, does not refer, in his account of botany at Cambridge, to a namesake of his, the Rev. Thomas Green, who was Professor of Botany at Cambridge and Woodwardian Professor of Fossils, and who died on June 7, 1788. He was, says the writer of his obituary notice in the *Gentleman's Magazine*, "deprived of the use of one side by a paralytic stroke, as he was shooting in Huntingdonshire last autumn, and with difficulty brought home to his College, and though he went thence to Bath, found no relief from its waters. His goodness of disposition, and his botanical knowledge, made him regretted by all who knew him." Another Cambridge man not recorded by Dr. Green or Messrs. Britten and Boulger, was John Saltons, who was Curator of the Botanic Gardens at that University, and who died July 4, 1794, but probably in those days a Curator was only a euphemism for caretaker

Messrs. Britten and Boulger mention Dr. Richard Kentish, who was President of the Society of Naturalists, Edinburgh, but give his period as "fl. 1782-1791." He died at the age of 62, on April 5, 1792, when he was at Bridlington, Yorks; a list of his publications is given in the *Biographical Dictionary of Living Authors*, 1816. Finally, reference may be made here to John Woolshafen, who was born in Canterbury, and who died there September 20, 1794, at the age of 74. He was described as "an excellent herbalist," and as the son of Mr. Woolshafen, "formerly an eminent apothecary in that city." *W. Roberts.*

TREATMENT OF LAWNS.

MANY lawns are infested with moss and "fairy rings" due to various Fungi. Both are best checked by a dressing of lime. This should not be applied alone, but mixed with rich garden loam, leaf-mould, and well-rotted farmyard manure. I am not in favour of stable manure as a substitute for mixed farmyard dung. As regards the kind of lime to use I favour ground quicklime, free from magnesium salts. It is mixed with the other materials at the rate of one to four, and all should be turned once or twice during the fortnight they remain in the heap. Dress the lawn at the rate of four to six cartloads per acre, that is, about three to four and a half tons per acre, or half to three-quarters of a cwt. per 40 square yards. Distribute the materials evenly and rake off the lumps.

The manurial treatment of lawns is a great problem, and particular cases can only be settled by experiment after taking into account such items as the soil, climate, aspect, drainage, proportion between grasses and Clovers, and the use to which the lawn is to be put. As all know, it is undesirable to encourage too much Clover, as it burns and wears badly, besides staining tennis balls and the like. If we suppose a loamy to light soil with no undue proportion of Clover, then the lime and soil may well be supplemented by some well-known lawn manure. Those who prefer to mix for themselves can try 2cwt.-3cwt. of basic slag or 2cwt. of steamed bone flour and 2cwt. of kainit per acre. Add these to the lime and soil when they are mixed. If the soil is heavy the kainit may be dispensed with, but in practice this is rather risky, as neither phosphates nor potash give such a satisfactory result when applied separately. If Clover abounds no autumn dressing will be advisable, but a light dressing of superphosphate (1cwt. per acre) and ½cwt. of sulphate of potash can be given about February. On sandy soils and those deficient in lime substitute 2cwt. of bone meal for the slag and use sulphate of potash instead of kainit. Apply both about the end of January. If the soil contains a sufficiency of lime apply about ¾cwt. of sulphate of ammonia in April, especially if Plantains are present; otherwise dress with 1cwt. of nitrate of soda per acre when the grass begins to grow.

If no seed has been sown in autumn and there are bare patches, about a bushel of a well-known seed mixture should be sown per acre. The date on which to do this will depend on the season, but in the south the middle of March will be suitable, and a month later in the north. The winter dressing will have worked in by this time, and the roller should be used, followed by the rake. Sow seed from north to south and east to west; rake lightly, and finish with the roller. Those who have the time and knowledge will doubtless compound their own seed mixtures, remembering that certain kinds of grasses are suited for certain soils and situations.

Weeds should be attended to in the spring when they are at their lowest vitality, and on small lawns guinea-pigs have been found most useful in ridding greensward of Daisies, Plantains, and Dandelions. *T.*

FIG. 61.—GLADIOLUS TRISTIS; FLOWERS BUFF, WITH PURPLE MARKINGS.

GLADIOLUS TRISTIS.

A GRACEFUL but not commonly-grown species of Gladiolus is G. tristis, a native of South Africa. It is a plant known to cultivation for a long number of years and recorded as flowering in the Chelsea Botanic Garden in 1745. The species is variable as to colour, a common form being buff or light sulphur-coloured, with pencillings of light purple on the three lower segments, the middle segment generally having a median band of this colour. Although the flowers are not strikingly effective the colouring is scarcely so sombre as to warrant the name of tristis, given by Linnaeus in the days of long ago.

G. tristis is quite hardy in the South of England, and is probably the earliest of Gladioli to flower out of doors. Moreover, it is easy of increase either from seeds or "spawn," i.e., small corms, and seeds ripen readily in Devon and Cornwall. More attractive than the type is G. tristis concolor, also known as G. t. sulphureus, which has clear, light, sulphur-yellow flowers.

The form of the blooms and their disposition on the slender spikes is well shown in Fig. 61, which illustrates some spikes which came from France to Covent Garden Market in the or-

dinary way of business, tied in bunches and packed closely together in the usual wicker pads. After a day in water the flowers expanded beautifully and emitted the delightful fragrance for which the species has had a reputation for the better part of 200 years. The spikes were over 2 feet long, and carried three or four expanded flowers at one time. No large quantities of these Gladioli spikes are sent from France, but some arrive with almost every consignment of flowers over a period of about three weeks. It is generally considered that none but gay blooms or those with decided colours are saleable in Covent Garden Flower Market, but this is scarcely true, because Gladiolus tristis and Iris tuberosa have been on sale for several weeks and, apparently, never have had to be thrown away for lack of a purchaser.—*C. H. C.*

PLUMS ON WALLS AND FENCES.

Among hardy fruits the Plum is much appreciated, as its fruiting extends over a long season. River's Early ripens in July, and Coe's Golden Drop hangs on the trees until the end of October. Varieties are numerous, and every sort has some claim to merit, such as appearance, type of flesh, flavour, growth or prolific cropping qualities.

Plums succeed in any aspect, and the more variable the sites the longer the season extends. Although trees in the open will, in some seasons, produce heavier crops, there is not the same reliability of cropping as from trees on walls or fences, owing to the protection such trees receive from frost and adverse weather conditions generally. Trees on walls are more easily protected from birds during the winter and early spring, when they destroy the buds, than those in the open, and in the latter case persistent lime spraying is necessary.

As a rule, fan-shaped trees are the most favoured and answer the purpose well, filling their allotted space in a short time. In some instances cordon-trained trees are employed with advantage to fill spaces between other permanent trees, recently planted. Cordon-trained trees may be advantageously employed wholly where there is a limited space and much variety is required.

If such trees are tained upright they may be planted 15 inches apart. It matters not whether the walls are high or low, Plum-trees will succeed, although, naturally, the higher the wall the greater is the crop. For walls or fences lower than 6 feet the trees require greater depression, and should be trained horizontally, or obliquely, to give greater length to the branches. The roots, too, should be kept in bounds by occasional pruning to reduce exuberant growth.

The aspect for the several varieties should be carefully chosen, and the sunniest spot selected for the finest dessert sorts. South walls facilitate the ripening of the fruits, and the additional sunshine promotes a rich flavour. Therefore south walls should be reserved for the early, choicer varieties. East walls suit all Gages and many other richly-flavoured sorts. North walls are suitable for free-bearing culinary varieties. Hardy varieties not addicted to skin cracking during wet weather succeed admirably in western aspects.

The space to allow for each fan-shaped tree varies according to the height of the wall. For instance, for a wall 12 feet high the trees should be planted 15 feet apart, and for those on walls 10 feet high 18 feet of space is required. In the case of walls and fences 6 feet high the trees should be planted at 20 feet apart.

The preparation of the soil is important. If the ground is excessively rich in manure the shoots become gross, and do not ripen well, ending in gumming and a scarcity of fruit. On the contrary, Plums should not be planted in very poor soil or they will make weakly, unfruitful growth. A safe plan is to add a small quantity of half-decayed farmyard manure at planting time to give the trees a start and supplement the supply as required.

The best soil for Plums is a medium loam overlying a well-drained subsoil, and it should be trenched 3 feet deep. Except in the case of a clay subsoil, it should not require artificial drainage, as the trenching will enable surplus water from excessive rains to percolate freely from the roots. Where a clay subsoil exists 13 inches of loamy soil is sufficient over a drainage formed of 6 inches of broken bricks, clinkers, or stones. Trees may be planted with success now, but they will require attention in watering and mulching should the summer be hot and dry, and especially during May and June. In deeply-trenched soil, plant the trees a few inches above the natural level to allow for the soil settling again.

Pruning the trees is an all important detail, and especially during the season of planting.

Fig. 62.—Group of Gladiolus tristis showing habit.
(*See page* 148.)

In the case of the autumn-planted trees February is a good time to prune. March planted trees should be pruned at the time of planting. Shorten all the shoots to within 6 inches or 8 inches of their origin. This method ensures well-furnished trees from the ground upward. Where the walls are low hard pruning is especially important, as a loss of fruiting branches near the base of the trees reduces the crop very considerably. Some growers allow the shoots to remain almost their whole length, just removing the point of each. In this system there is a danger of the lower buds failing to start into growth, with the result that the trees become bare at the base.

The subsequent shoots should be carefully trained, especially in the first year, to obtain well-balanced trees that will furnish the wall space as quickly as possible. All superfluous shoots should be cut back to within 3 inches or so of their base at the end of June, these being reduced to one bud at the winter pruning. In this way fruiting spurs are formed.

Of insect pests that attack the Plum, green and black fly are the most troublesome in spring. Timely spraying of the trees with paraffin emulsion, soft soap and tobacco water, quassia water or "Katakilla," a powder prepared by McDougall, are all efficacious. Red spider sometimes attacks the lower part of the trees, owing mainly to absence of moisture at the roots. Daily syringing of the trees after a hot day will help to keep the trees healthy, and mulchings of light, half-decayed farmyard manure are beneficial during the hot, dry weather.

The following is a list of desirable varieties for various sites :—

South Wall.—Kirke's, dark purple, rich flavour, one of the best dessert plums, ripening at the end of August. Jefferson, golden yellow, excellent flavour, an abundant bearer; ripe in September. Golden Transparent Gage, one of the richest and most delicious Plums; colour greenish-yellow; ripe in September. Late Transparent Gage, greenish yellow, changing to purple when exposed to the sun; rich in flavour; ripe at the end of September. Oullin's Golden Gage, skin greenish yellow, dotted crimson; handsome, juicy, and rich; middle to end of August. Reine Claude de Bavary, yellowish green, rich and juicy; September. Coe's

Violet, a sport from Coe's Golden Drop; a grand September Plum in every respect. Blue Rock, an early August Plum. Denniston's Superb: ripens early in August; fruit greenish yellow and of good flavour.

East Wall.—Coe's Golden Drop, one of the finest of all Plums; the tree crops abundantly, and the fruits frequently hang on the trees until the end of October. Trees of Kirke's and Jefferson do equally well in east aspects; Orleans is one of the best early kitchen Plums, ripening in August. Victoria cannot be omitted from any list of Plums, no matter how small; it is the most certain cropper of all, and one of the best for kitchen use. Late Orange is of excellent flavour; colour, orange yellow with a light bloom on the surface. Bryanstone Gage, ripens in mid-September, and is good in every respect. Belle de Louvain, produces heavy crops, and the fruit is valuable in the kitchen. President, of a deep purple colour, ripens in October; as a market Plum it will be valuable. Primate is a new, purplish-red variety, ripening in October. The Czar bears abundantly, and the fruits are ripe in August and may supersede Orleans. Pershore Purple is an early August variety; a very heavy cropper, useful for market.

West Wall.—Monarch is one of the best of late Plums; the fruit does not crack during wet weather, which is an important point; it is an excellent variety for bottling. Pond's Seedling is the best of all Plums for kitchen use; the fruits are fleshy, crisp and juicy. Sultan is useful either for dessert or the kitchen; the tree grows freely and bears abundantly reddish-purple fruit. White Magnum Bonum, ripens early in September; the fruits are pale cream yellow in colour, and are good for preserving or bottling; the tree grows to a large size. Count Althann's Gage, ripens at the end of September, is of rich flavour, roundish and of a reddish-purple colour. Autumn Compôte is a large, oval-shaped fruit with an amber flush on the sunny side. Blue Imperatrice is of medium size, covered with a thick blue bloom; a useful culinary Plum in October.

North Wall.—Jefferson, Count Althann's Gage, Coe's Golden Drop, Monarch and Pond's Seedling will all succeed on north walls or fences. *E. Molyneux.*

THE VEGETATION OF THE CRATER AND SUMMIT OF MOUNT ELGON.

(*Concluded from page 138.*)

Reminders of the lowland vegetation of Uganda are exemplified in a Commelina (the same species found gregariously in the spray of the Ripon Falls), Sebaea and Swertia (both Gentianaceous genera of the Tropics), and an exquisitely dissected-leaved Rhamphicarpa, unknown to science, with glaringly mauve flowers.

Cryptogams specifically occupy the first place in the scheme of vegetation, representing about 35 per cent. of the species collected. The majority of these are Mosses and Lichens, which remain as yet to be determined. Only three Ferns obtain; the South African Asplenium furcatum, and a very distinct variety of that species, with hirsute stipes. The other Fern is Actiniopteris radiata.

Fungi are exceedingly rare, and only one species was found, apparently parasitic on a tree heath—a Fuligo. In the Bamboo Zone a solitary specimen of an enormous Daldinia was met with, as large as a child's head, and with furrows and markings not unlike the convolutions of the adult brain. No leaf fungi were noticed anywhere on the route.

Of the flowering plants of the crater, Composites occupy the highest place with about 20 species, of which a large proportion are Helichrysums—the Everlastings alluded to. Grasses are represented by half that number, though the Sedge Order has only one to its credit; Rosaceae and Caryophyllaceae respectively by 6 and 5, and the remaining Orders (approximately 32) by 1—4 species.

Elgon does not agree with Volken's remarks anent the frequency of bulbous and tuberous plants. Monocotyledons occupy a relatively low position.

There are only two Orchids, a Red Hot Poker plant, a Bulbine? (not in flower), two Gladioli and Dierama—the Sparaxis pendula—a beautiful bell-shaped, lilac-mauve Irid, a Romulea species, and possibly an Aristea.

The Peak itself is a boulder-strewn, wedge-shaped knob of the crater-lip, about 100 feet high, covered with a striking, silvery leaved, shrubby, sprawling Cliffortia?—2 feet high—a Rosaceous plant—one of the floral gems of these heights, whose stipules, ruby red in colour, act as a foil to the argent leaves. This peak, with its strange garb, must be an intensely beautiful sight on a clear, sunny day. Only about half-a-dozen distinct flowering plants occupy this rocky mass, of which a hoary-leaved, sprawling Lady's Mantle (Alchemilla) is the most prevalent and ubiquitous. Lichens, as expected, are frequent, Physcia and Parmelia particularly covering the top-most rocks. It was too cold to chip off the less foliaceous types, an omission I sincerely trust will be rectified by the next enthusiast. A few empty sardine-tins recall Byron's

"Man marks the earth with ruin,
His control stops with the sea."

To any botanists who may subsequently visit Elgon, I commend the exploration of the three peculiar table-lands, each successively smaller than the other, which stretch westward of the Peak on the ridge of the crater. Their conformation appears to offer also specially interesting geological features.

Animal life is by no means wanting, apart from the savages and their stock. The white-necked crow hovers about these heights, and swifts and swallows twitter away in the sunshine (when there is any). A chameleon was secured, but distinct from either of those depicted by Johnson in his classic, *The Uganda Protectorate.* A lizard, very like the one of Signal Hill, above Cape Town, wriggles occasionally through the grass, and beetles and spiders are particularly abundant in the dried leaves of the Tree Groundsels which, reflexed with age, enfold their stems. Of mammals, the mole is very frequent, its mounds being everywhere. A dwarf type of mountain buffalo is reputed to be present, but we failed to see its tracks.

Sir Harry Johnston, in his work alluded to, proffers a tentative list of the plants collected by him on the slopes of Elgon and the adjoining Nandi Plateau, embracing about 112 species, of which, however, only 10 can be conscientiously referred to as Alpine plants, the remainder being of the slopes and lowlands.

This expedition is, therefore, the first serious attempt at exploiting the crater and summit of Elgon, and its slopes, the material collected numbering over 5,000 specimens, representing over 2,000 ticketed specimens, and embracing about 600 distinct types.

The scientific results, it is hoped, will be subsequently published in a separate memoir, and the collections and data of Johnston, Battiscombe and others, as also of Mr. Snowden, District Agricultural Officer, who visited Elgon in 1917 and collected further material, duly embodied therein.

In penning this short article the writer is actuated by a desire to show what an untrodden field, what a veritable Eldorado, Elgon presents to the naturalist and to the nature lover. We have only touched the fringe of the natural wealth of this mountain mass, and if subsequent trippers and travellers would only collect material, and communicate this and their data to Kew or the British Museum, we would eventually amass a fund of information which, intelligibly interpreted will give some adequate representation of one of the most striking topographic features of the Uganda Protectorate—Elgon.

Botanical science generally is too much in the background, despite the teachings of the utility of science in this war, simply because it shows no immediate material gain.

Collecting should be stimulated by the powers that be, and the creation of an adequate herbarium representative of the vegetation of Uganda be made as one of the pressing needs of the department it concerns.

East Africa (German) had its sumptuously compiled Flora worked up by experts. We have only Dawes' 65 paged *Economic Resources of Uganda*, the only real serious attempt at literature of this kind, and now practically obsolete. The compilation of a Manual of Uganda Trees and their timbers, and the working up of the flora of this inexhaustible region should be undertaken, and, lastly, an inquiry into the possible medicinal values of many of its herbs, shrubs and trees be instituted, and botanical work generally pushed forward.

In conclusion, it is a pleasant duty to refer to the courtesy and genial hospitality of the District Commissioner, Mr. Perryman, and his staff at Mbale, who throughout assisted us in every possible way, thus materially contributing to the success of the expedition. *R. A. Drummer.*

TREES AND SHRUBS.

ABIES FORRESTII.

MANY of the so-called new Chinese Conifers, grown from seed collected by Wilson and Forrest, in their separate expeditions some eight or ten years ago, are now maturing into the state of established and assured adolescence.

The possession of them has doubtless given pleasure and interest to their owners, but there is one little drawback, one little rift within the lute, the baffling perplexity that surrounds their nomenclature.

An appointed day for their orthodox christening seems to have been, somehow or other, overlooked in the ceremony of their existence. Even around those to which names are generally supposed to have been attached, a continual state of battle for the holding of their title seems to rage. All this sort of skirmishing offers bewilderment to those anxious to pierce the veil of mystery, and to talk of them by name, as one amateur dendrologist to another.

When we hear, and we do at times, that labels have been wrongly affixed to seeds sent back, confusion arises. We may know the tree perfectly, its characteristics, its outstanding features, its idiosyncrasies in general, the length and colour shades of its leaf, the shape of their apices, the surface and colour of its twigs, nearly everything that is to be known about it except its undue cone, and yet often our lips are left without a name to bless it with.

But the object of this letter is not despairing discontent, but congratulation on the fact that the name of one plant, which has long endured the privations of anonymity—a certain Silver Fir, the best and most beautiful of all Silver Firs, I dare to say, unless I except the Himalayan Abies Webbiana—has been extracted from those entitled to play the part of potential god parent, and the name conferred is Abies Forrestii. I render my personal thanks to Prof. Bayley Balfour, Regius Keeper of the Royal Botanic Gardens, Edinburgh, in that he has accorded us permission to call the tree referred to, and which is numbered by Forrest in the Bees Expedition 6744 (if I have it rightly) after the name of its renowned discoverer.

A second object of this letter is, if possible, to elicit opinions and experiences from other owners of this tree. It came, labelled, to an exhibition of Chinese Conifers we had at the Shrewsbury Royal Agricultural Society's show at Shrewsbury in 1914, as A. Delavayii, and as such it came labelled in the form of seed, so far as I can recall.

Now A. Delavayii has been what is called "described," that is authoritatively once for all and finally defined inside and out, through and throughout, and registered so to speak in the recognised Stud Book of botanical certification, with full credentials of authoritative identification. It requires no second Daniel to come to judgment upon this point, that neither the A. Delavayii, nor its pubescent affinity A. Faxonia, have any connection with the subject of this discourse, A. Forrestii. The arrangement, the position, the lengths of their leaves, the external surface and the colour of the twigs, all have proclaimed the fact of their separate entity, with clarion clearness.

Let me try and give a primâ facie idea of some of its characteristics—not try and describe

it, if I could, as do the authorities, in words of learned length and wondrous Latin sound, but in simple unsophisticated homespun strain of mother tongue.

The most noticeable feature that first catches the eye, is the brilliant, vivid, silver-white stomatiferous effect of the underside of the leaves. No other tree except the more than often short-lived A. Webbiana can be compared to it on this point. The next, perhaps most arresting characteristic is the bright, dark orange, glabrous, and smooth-surfaced twigs, which seem to glow with a redundant and unexcelled robustness of health, that, for instance of comparison, the lighter coloured, corrugated, pubescent in grooves, twigs of the Himalayan Webbiana neither seem to attain nor maintain.

Again, the aggressively upright position of the median leaves, neither bending forward, as do many of the genus, nor backwards as only the A. humidica does, but standing up straightly, disclosing no bare centre of V depression, and so straight up as to expose the silvery-white effect of the underneath of the leaf to the beholder looking down upon it, as do the lower ranks to those who view it from below.

The length of the leaf is 1⅜ inch (rather shorter than that of its rival A. Webbiana), and the length of the median leaves is about 1⅛ inch. The apex of the leaf is notched, not sharply bifid, as in the case of A. Webbiana, and the colour of the upper side of the leaf is a dark, rich green. Perhaps when we have paid a tribute to the robust appearance of its growth, and testified to the fact that the highest of many planted here in Radnorshire, at altitudes varying from 700 to 800 feet above sea level, measured over 7 feet in 1918, our conscience should smite us that we are beginning to outstay our welcome in your columns. *Chas. Coltman Rogers, Stanage Park, Radnorshire.*

THE ALPINE GARDEN.

COPTIS.

THE interesting genus Coptis belongs to the Ranunculus family, and consists of about half a dozen species of low-growing evergreen plants spread over the whole of the North Temperate zone. Coptis is closely related to Anemone, Helleborus and Thalictrum. The name Coptis signifies "cut" in reference to the numerous divisions of the leaves. The species are mostly woodland plants, and all thrive in partly shaded situations. They flower very early in the year and are useful subjects for the rock garden. Most of the species produce seeds, by means of which they can be increased. All grow well in light, rich, well-drained soils that do not become excessively dry. The following five species are probably all in cultivation:—

C. ASPLENIFOLIA.—The leaves of this species have very much the appearance of the Spleenwort or Asplenium, from which the specific name is derived. They are biternate, while the leaflets are pinnatifid and deeply cut. The scapes grow about nine inches high, and usually bear two white flowers with five petals. This species is found in the Sphagnum bogs of North-Western America and also in Japan.

C. BRACHYPETALA.—This plant is similar to C. asplenifolia in habit, but has more finely-cut leaves which have acute divisions. The pretty, white flowers are produced early in March on scapes a few inches high. This species is a native of Japan.

C. OCCIDENTALIS.—This is one of the largest species. It grows more than a foot in height. The leaves are trifoliolate and the leaflets are about three inches across, deeply and unequally cut and lobed. The white flowers have six petals and are usually produced three together on each scape. The plant is a native of North America.

C. ORIENTALIS (see fig. 63).—This species blooms in February, and makes a good plant for the alpine house with its bronzy leaves and scapes of white flowers. When in flower the plant is about six inches high: the flower scapes of this species, as well as those of all the others, develop considerably after flowering. The plant is a native of Japan.

C. TRIFOLIA.—This, the most widely spread and commonest species of all the Coptis, is found in the mossy woods of Canada, Siberia and Northern Europe. It forms a dwarf-growing, creeping plant with trifoliolate leaves and pretty, white flowers on single-flowered scapes three to four inches long. The roots are yellow, and together with the leaves, are used for producing a yellow dye. From this fact it receives its common name of "Gold Thread." It is a suitable plant for the peaty bog, soon spreading and forming an evergreen carpet studded from April to July with flowers. *W. I.*

THE ROSARY.

YELLOW ROSES.

I AM grateful to your correspondents, Messrs. Walter Easlea and Matchett Watson, for their comments on my articles on Yellow Roses. I think Mr. Easlea is right in suggesting that Mme. Chédanne Guinoisseaux should have been included (I take the spelling of the name from the *Noms des Roses,* which is usually accurate). This Rose was brought out in 1880, and I still present I have seen no beds of it in my friends' gardens that would induce me to alter my opinion.

Iona Herdman had the same fate, but seemed even a worse grower, as it did little even as a maiden. This I much regretted, for it has magnificent colour. Of the other Roses mentioned by Mr. Easlea I have as yet no experience.

Mr. Watson refers to the question of perfume, and here, perhaps, I must plead some personal defect. I am fully conscious that Duchess of Wellington variety has a perfume which is pleasing to others, and which I recognise as a scent which, if left to myself, I should describe as of the Tea Rose type. But I recognise fragrance of this type rather as a result of practice than of any pleasurable sensation it produces, and I think I must be, at least in part, "smell-blind" to odours of this description.

Lady Greenall is a Rose of which I grow a good group, and appreciate highly in some respects. It is an excellent grower, with lovely foliage, and the flowers, though thin, are well formed. It has, however, two serious faults,

[*Photograph by W. Irving.*

FIG. 63.—COPTIS ORIENTALIS; FLOWERS WHITE.

have a plant or two of it. With me, though it grows well, it is too poor in form to be worth much attention, but as I have seen it growing in Gloucestershire gardens it is quite a different Rose, and well worthy of all Mr. Easlea writes about it.

Medea and Mme. Hoste are both fine exhibition Teas, but were omitted from my list as too pale in colour for the class of Roses I was considering. Mme. Hoste is perhaps near the border line in this respect. Of late years I have grown it entirely as standards, but, alas! I shall have no flowers from them this year, for every one of them was destroyed by the heavy, clinging snows of February, which seriously crippled several of my standards, and in the case of Mme. Hoste destroyed the remaining plants by breaking them off below the insertion of the buds.

Margaret Dickson Hamil was tried for two years here, but though it came well as a maiden it declined to grow as a cutback, and was therefore discarded. Hence its omission. Of course, I may have been unfortunate, but down to the which induced me to omit it. One is that the beautiful, bronzed foliage is very readily attacked by mildew, and the other that the substance of the petal is not strong enough to withstand wet weather, which soon deprives it of colour and spoils the flowers. Moreover, it is only the early flowers that are first rate in colour; the later ones are apt to lose it alike from the effects of rain and sun, which is scarcely satisfactory.

It is essential that the Yellow Rose of which we are in search should keep its colour in the autumn flowers as well as those of early and mid-summer.

THE LAST ROSE OF WINTER.

FOR some years past I have tried to notice the last Rose flowers we have been able to pick in the season. With an ordinarily open autumn, such as in 1918, we now get several varieties flowering more or less down to Christmas; but after this, even though the weather continues mild through the early part of January, the

outdoor Roses become few, and those that are worth gathering easily noticeable.

I doubt whether any general principle emerges from a list of the latest Roses, except perhaps this, that the plants that have bloomed most freely and continuously through the season usually find a place among the latest varieties. But the nights are then so long and the weather so trying, even to the most persistent flowerers, that it is something a matter of luck which varieties find a place in any year as the latest in bloom. Thus the latest Roses are found to include both full flowers and thin, provided the substance of petal is fairly stout. In one year I have Frau Karl Druschki, in another Mrs. Walter Easlea. Edu Meyer has appeared more than once, and even some of the Chinas.

This year in the last week of the Christmas vacation, about 6th January, I picked three quite good vases of Red Letter Day, which ended a fine season for this Rose, that had flowered continuously since June; and on the first day of the Hilary term, 11th January, my wife gathered enough flowers of Mme. Edouard Herriot, the "Daily Mail" Rose, to make quite a creditable decoration for the dinner table, without aid from any other flowers or foliage. These were practically the last Roses we had of the season, for though a bed of Edu Meyer afterwards produced a good crop of buds they were unable to open.

It was perhaps permissible, in these evil days for the garden, to feel a small triumph in obtaining these two Roses so late in the season, for both are somewhat easily affected by black spot, than which nothing is more fatal to autumn flowering, and both beds had in the past suffered more or less from this plague, but constant attention in dusting the plants with flower of sulphur, when the weather was sufficiently warm to make this effective, succeeded in warding off any serious attack last season. *White Rose.*

FRAGRANT WICHURAIANA ROSES.

THE Wichuraiana Roses are decorative subjects of the highest value in the adornment of the garden, and their free-flowering qualities are reflected in the beauties of many arches, pillars, pergolas, and other structures which lend themselves so admirably to the character of these Ramblers. There is, however, one unfortunate characteristic common to this class of Rose, and that is a general lack of fragrance. Opulent in blossom most of them undoubtedly are, but few have the perfume that is considered an essential attribute of all good Roses. Of the older varieties among the Wichuraiana hybrids, Gardenia and Alberic Barbier certainly possess a decided perfume, and so in a measure does René André. But it is to the newer introductions that we are indebted for a strong and decided richness of fragrance. Sylvia is probably the first of the strongly perfumed varieties, but, unfortunately, it lacks a good climbing habit, and in this respect it is one of the weakest growers in the section in which it is classed. Sanders' White Rambler, the best white Wichuraiana Rose, is perhaps the most sweetly scented of all. One cannot pass an erection which is clothed with this Rose without pausing to ask from whence comes the fragrance. It is also a good, strong grower, highly, if not wholly, resistant to mildew, and it bears elegant trusses of well-formed flowers of the purest white. It is not so widely known as it deserves, but it will probably become one of the most popular of the Ramblers in a year or two. Edgar Andrieu is an admirable companion to Sanders' White Rambler. It is a variety sent out by Barbier in 1913, and the raiser states that it is derived from R. Wichuraiana × Cramoisie Supérieur. Here we have an interesting combination, and possibly the first example of a union of the China blood with that of R. Wichuraiana. The fragrance of Edgar Andrieu is very strong, and the colour of the flowers is a rich blood-red shaded with deeper crimson. The highly polished foliage is mildew-proof. This and Sander's White Rambler are two varieties worthy of the attention of every grower who wishes to cultivate Ramblers that possess a delightful perfume. *George M. Taylor, Mid-Lothian.*

NURSERIES IN THE WAR DEVASTATED AREAS.

I AM writing these brief notes in Germany, after being some few months in France and across Belgium, and my mind carries me back to devastated areas where not a house stands complete for miles and not a civilian is to be seen, or was not during the period I am thinking of, just a few weeks prior to the armistice.

From Amiens to Villers Bretoneaux; to Froissy, La Flaque and Bray: back to Marchelpôt, and thence forward from Villers Carbonnel, Poeuilly, Vermand, across the once famous Hindenberg Line at Bellenglise, over the St. Quentin Canal, and away ahead to Le Cateau—is practically a vast waste, more particularly up to the Canal, for there the German horde broke into precipitate retreat—so rapid, in fact, that our own artillerymen will tell you that our guns frequently "lost touch" with the Germans entirely.

Often have I wandered round the ruins of Caulaincourt, Poeuilly, Vermand and other villages, scrambling over piles of bricks and broken walls, peeping into cellars, and generally "scrounging round"—to use the military slang term which implies "doing nothing in particular." And on such occasions it has usually been my luck to tumble across what was once a garden.

One such occasion brought me into what must have been a nursery garden, and a description will suffice to explain not only the one, but hundreds, even thousands of similar cases.

The gardens ran from the corner of two cross roads and stretched a considerable distance from the roads, being roughly diamond shaped.

Along the back were the remains of glass houses and frames, an occasional iron pillar and portions of the brick walls being all that remained, save for a few pieces of broken glass, scrap iron, burnt timber, and the powdered remains of flower pots. The water tanks were more or less full of rubbish, and a one-time heating apparatus lay in fragments in the chaos of a one-time stokehole.

Walking round—to walk on paths was impossible, for there were none in particular—I endeavoured to trace out, with the assistance of paper and pencil, the general plan of the gardens. I had unconsciously attempted a more difficult task than I had anticipated, but so far as I could discern the paths ran parallel to the road walls, or rather hedges, thus giving a diamond form to the general plan.

The whole place can best be described as "chaotic." Weeds were absolutely prolific; two Rose bushes (one still bore a bloom or two, which I packed into a tin box and sent home) and a few clumps of Michaelmas Daisies, in a far corner a straggly bed of Mint, and a Lavender, represented the entire stock of plants in the grounds.

What a problem faces the owner on his return—if ever he does return! Perhaps I saw him at Cartignies, where, from the office window, I watched the crowds of liberated French and Belgians loading their few goods and chattels on to the British W.D. motor lorries conveying them hither and thither to (I almost said) homes, but that in the vast majority of cases would not be true—for their homes were like the old garden, a chaos. "A little help is worth a lot of pity." The French and Belgian nurseryman has to face a dismal, almost hopeless looking future. Years must elapse before he can see any recompense for his labour. He has to "start again."

But the greatest problem he has to face is not the chaos, but the question, "How can I do it?"

The only echo the British nurseryman can send back is, "We will help you!"

In the rebuilding of Belgium and France, the already strong links uniting them with us will be strengthened, for the mutual advantage of all, and British nurserymen must see to it that their addition to the chain is not missed.—"*One of the Archers.*"

The Week's Work.

HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Pear Trees on Walls.—The flower buds on Pear trees are well advanced, and crowded or unsightly spurs should be cut back, to keep the trees in a good shape and assure a large crop. Where the fruit buds are very numerous it is as well to thin them a little: this will save much work in thinning the fruit later and allow more light to reach those that remain.

Manuring.—Pear trees on light soils are greatly benefited by dressing the roots with nitrate of soda as soon as top-growth starts, and also after the fruit has set. The fertiliser should be applied at the rate of ½oz. per square yard. It should not be given to trees that produce plenty of wood and little fruit.

Protecting Fruit Blossom.—Pear blooms of many varieties are very tender, open very early, and are very subject to damage by frost. They should, therefore, be protected, using means similar to those recommended for Peaches in a previous issue.

Cracking in Pears.—In many gardens Pear fruits crack through the agency of a fungus. The trouble is worse in the case of trees growing in soil that is inefficiently drained, and depends also on the quality of the soil itself. It is now too late to deal with the drainage, but the ground may be improved by the use of a good fertiliser. Trees liable to attack should be sprayed with a solution of sulphate of copper, ½lb. to 12 gallons of water, just before the buds commence to swell. The specific should be applied when the trees are dry. When the trusses show, but before the flowers expand, the trees should be sprayed with the following mixture:—¼lb. Paris green to 70 gallons water, with sufficient slaked quicklime to make it the colour of skim milk. The spraying should be repeated after the fruit has set, and again every three weeks until June. This specific also acts as a preventive of insect pests that feed on the foliage. The same mixture may be used for Apples, but should be diluted with another 50 gallons of water.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Cattleya, Laelia, and Laelio-Cattleya.—The numerous species and hybrids in these sections comprise an important group of the finest and most popular Orchids in cultivation, and unequalled for the gorgeous character of their flowers. The chief points to observe in their culture are to get the growth developed in season and well-ripened, to have consolidated pseudo-bulbs, and to keep all plants that require rest dormant in winter. One of the chief, if not the sole, reason why these Orchids fail to succeed in some places is that they are so frequently over-watered at the roots. Wherever the material in which these plants are potted is kept, even during the growing season, in anything approaching a very wet condition, their roots are certain to die prematurely, and not only the old roots, but the new ones in course of formation, will rot in material that is kept too moist. The quantity of root moisture the plants require depends largely on the amount of light they receive, and this will be governed by the nature of the house in which they are grown, and their position in relation to the roof glass. The plants require considerably more water when exposed to full sunlight than they will do when heavily shaded, as under the former conditions the strengthening influence of good light enables the plants to assimilate more moisture. Also the extent to which air is admitted, and the amount of atmospheric moisture in the house will

obviously have a great influence on the amount of water required by the roots.

Repotting.—During the present and succeeding months Orchid growers will be busy repotting these plants. The late-summer and autumn-flowering kinds are best repotted now, and the work should not be much longer delayed, for although the roots above the surface may not appear to be very active, those below will be, and this condition should be taken advantage of to get the plants established in the new compost. Those of the late-winter and spring-flowering section can seldom be too quickly repotted after blooming, as a considerable number of new roots frequently develop soon after from the base of the flowering pseudo-bulb, and these help in re-establishing the plant quickly. The treatment of the roots is the same for all: they all require a rough class of material, Osmunda or Al fibre about three-fifths with one-fifth each of Polypodium fibre and Sphagnum-moss, and a good sprinkling of crushed crocks and charcoal. Provide perfect drainage, and in potting press the compost firmly about the roots. Frequent disturbance of these plants is harmful rather than good, and large specimens may be allowed to grow for two to four years without being repotted. When repotting is necessary the work should be done thoroughly, and all old, sour material and decayed roots removed, as well as all useless back pseudo-bulbs, which are not only a drain on the plants' energies, but, if allowed to remain, necessitate the use of large receptacles. Three or four pseudo-bulbs behind each lead are sufficient.

Brassovola Digbyana.—From this fine old species has been raised a number of beautiful hybrids by crossing it with the members of the above-named families. They include some of the most exquisitely beautiful Orchids in cultivation. Culturally, this species and its hybrids, in practically every instance, require similar treatment to that recommended for Cattleyas, Laelias, and Laelio-Cattleyas.

PLANTS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Ornamental Foliage Plants.—Codiaeums (Crotons) and Dracaenas should be repotted now, in a compost of fibrous loam, peat, leaf-mould and sharp sand. Pot firmly, and place the plants in a warm, shaded house, where they may be syringed twice daily with warm water. To destroy insects use an insecticide, and subsequently syringe the plants with clean water. Young stock raised by ringing or from cuttings should be placed into 3 inch or 4 inch pots when sufficiently rooted. Place them in a close propagating pit, and syringe lightly until well rooted, when they may be removed to brighter and more airy conditions.

Pandanus Veitchii.—The variegated Pandanus Veitchii is a most serviceable ornamental-foliaged plant for decorations. To preserve the best form of vegetation comparatively small pots should be used, and light, sandy soil. Keep the plants rather dry at the roots and expose them to the light. When taking cuttings from the old plants, choose those of slender and variegated growth, insert them singly in small pots in sandy soil, and place them in a warm propagating-frame until rooted.

Caladiums.—Potted on now singly, in medium-sized pots, in a mixture of loam, leaf mould and sand, and grown in a moist atmosphere and a temperature of 60°, Caladiums should do well. When established, afford plenty of light, as this renders the beautiful foliage less liable to flag when the plants are used for decorative purposes. The small-leaved C. argyrites is most useful for table decoration, or as an edging in a plant-house.

Bulbs.—To prolong the period of spring-flowering bulbs, place them in cold frames with a north aspect, and bring them into the flowering-house as required. Give shade from strong sunshine, ample ventilation, and plenty of water at the roots. As they pass out of flower, remove them to a cold frame, and continue to water them until the foliage dies down. Freesias, in particular, should have careful attention, in the matters of watering and feeding, until the foliage has quite died down. May-flowering and Darwin Tulips provide the latest batch of flowering bulbs. When needed for use as cut-flowers, cut the blooms before they expand and they will last a long time in water.

Shading Plant-houses. Blinds of such materials as tiffany, scrim and white cotton, are suitable for shading purposes, if fixed on rollers so that they may be let down or pulled up, as required. Shading should only be used during bright sunshine, being withdrawn each day when the sun's rays strike indirectly on the glass roof.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park Gardens, Barnet, Hertfordshire.

Summer Bedding Plants.—Seedling plants for summer bedding will need very careful attention just now. Prick them out early and encourage growth by placing them in gentle warmth, but a not too humid atmosphere, the aim being to secure healthy growth and sturdy plants. All young seedlings should be very carefully watered, especially in dull weather, otherwise many may damp off. Place them in a light, sandy compost warmed to the same temperature as that of the house in which the seedlings were raised. Keep the plants near the roof glass and shade them slightly during sunshine until they become established.

Zinnias, Asters and Stocks.—It is a mistake to sow Zinnias, Asters and Stocks too early, nor should they be raised in great heat, because early-raised plants, which cannot be safely planted out before the first or second week in June, receive a check and assume a sickly appearance by planting time. I consider the middle of April the best time to sow the seeds.

Various Annuals.—Seeds of most of the popular annual flowers should be sown from now onwards in light soil, covering the seeds lightly with finely-sifted sandy soil. See that each kind and variety is properly labelled and protected from birds.

Planting.—Any further planting should be carried out at once. Hollies and Rhododendrons may be planted late with good results, but the larger and choicer plants to be removed at this period should be most carefully taken up and planted with large balls of soil adhering to the roots. Afterwards they should be mulched, kept well supplied with water and syringed overhead in dry weather, otherwise many of the leaves will fall.

Climbers for Walls.—Both deciduous and evergreen plants suitable for covering walls and fences should be planted at once. If Ivies, Vines, Roses and Clematises are in pots, and the roots have become cramped and dry, soak them for some time and disentangle the roots so that they may be spread out when planted. Thoroughly prepare the stations so as to give the plants a good chance of growing freely at once, thus enabling them to cover a larger amount of space as rapidly as possible.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Rhubarb.—On heavy land the planting of new plots of Rhubarb should be carried out at once. Plant the crowns 3 feet apart, in rows 4 feet apart. Place some leaf-soil in immediate contact with the roots, as this ensures quick root action. After planting is finished mulch the surface of the plot with partially decayed manure.

Forming New Asparagus Beds.—The next ten days provide the best period in which to plant new beds of Asparagus. If the site was well prepared during the past autumn by trenching and manuring the ground will now be in a good condition. Previous to forking or harrowing the surface, give a dressing of burnt garden refuse, and when all is ready plant the roots, promptly, 15 inches apart and at a depth of 4 inches. Spread the roots very carefully and surround them with the finer particles of soil, remembering that too great pains cannot be taken with this important crop. On no account let the roots be exposed before planting.

Tomatos.—The batch of Tomatos raised in January will be ready for transference to their fruiting pots. Use 8 inch or 10 inch pots, place one crock over the drainage hole and some fibrous loam or moss over it. For the final potting use a compost of three parts good loam and one part burnt garden refuse, with a little road grit. Pot firmly and low, so as to allow for periodical top dressings.

Perpetual Spinach.—During the past six weeks the value of Perpetual Spinach has been fully proved. This vegetable has stood the extremes of frost and rain wonderfully well, and maintained a steady growth all the time, whereas the Prickly type has suffered greatly. Where much Spinach is needed, one sowing of the Perpetual kind should be made now and another during July. Sow in drills 14 inches apart, and thin the seedlings to 6 inches apart.

Broccoli.—A batch of Michaelmas White and Self-Protecting Broccoli should be sown in a cold frame to provide successional supplies.

Parsley.—Whenever the ground is in a suitable condition make a sowing of Parsley. If sown in a shallow drill one foot from the Box or other edging this crop will form an attractive and profitable feature.

Peas.—The early sown Peas raised in boxes will now be ready to plant out, drawing drills about 3 inches in depth and planting the seedlings evenly and firmly. If slugs are troublesome ashes placed on each side of the rows will check them. Stake the Peas at once, as the stakes will shelter the plants from frost and winds.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to C. H. Berners, Esq. Wolverstone Park Gardens, Ipswich.

Figs in Pots.—The fruits on the earliest Fig trees will now be nearing the ripening period. As soon as they show signs of maturing the ventilation of the house should be judiciously increased, and the atmospheric moisture reduced. Sufficient fire-heat should be maintained to afford a night temperature of about 65°, with a further rise of 5° to 10° by day, otherwise the prospects of a good second crop will be impaired. Syringing should be discontinued when the fruits are ripening, and an undue amount of atmospheric moisture must be prevented when closing the house or there will be the danger of the fruits cracking and splitting badly. A close watch must be kept for any signs of red spider on the leaves, and if the pest appears sponge the foliage with soapy water. The quality of the fruits will be enhanced by free exposure to sun and air, *i.e.*, by thinning and stopping the shoots. When applying stimulants during the ripening period, never use manures with an offensive odour, or the flavour of the fruits may be impaired.

Unheated Orchard House.—If the house is unheated it is advisable to allow fruit trees to develop slowly. Comparatively cool treatment up to the time the flowers commence to open generally means finer flowers, and better prospects of a good set. As the trees come into flower, every possible means must be exercised to produce a genial, buoyant atmosphere. Cherries, Apricots and Plums in particular, will suffer badly if the atmosphere is close and damp. Cherries when in flower should have the pollen distributed daily by means of a soft, feather brush. Apples and Pears may be transplanted to fill vacancies right up to the time the buds are ready to burst, if the operation is carefully carried out; but the trees should have plenty of fibrous roots, or the operation will be a failure. If there is a reserve stock of trees prepared for emergencies, it will not be a difficult matter to find those suitable for the purpose.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER, 41, Wellington Street, Covent Garden, W.C.**

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

SALES FOR THE ENSUING WEEK.

TUESDAY AND TWO FOLLOWING DAYS—
Sale of the Collection of Orchids formed by the late F. Menteith Ogilvie, Esq., at the Shrubbery, Oxford, at 11 o'clock each day, by Protheroe & Morris.

WEDNESDAY—
Fruit Trees, Roses, Rhododendrons, &c., at 1 o'clock; Azalea Indica and Begonias at 4 o'clock, by Protheroe & Morris.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 45.5°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday, March* 26, 10 a.m.: Bar. 29.80; temp., 40°. Weather—Dull.

Revision of Pritzel. The decision of the Royal Horticultural Society to proceed with the revision of one of the most useful and indispensable volumes in a horticultural or botanical library, i.e., Pritzel's *Icones Plantarum*, will meet with the approval of all lovers of plants. The merit of moving in this direction is due to a few energetic Fellows of that Society, and their services should be put on record on the score of our gratitude for them. About ten years ago, Mr. E. A. Bowles advocated the preparation of a new edition, brought down to the present day, but his efforts were not immediately successful. Mr. H. J. Elwes, F.R.S., too, frequently urged the publication at the anniversary meetings, and thus kept the movement constantly before the attention of the Society. After the International Exhibition held in 1912 in the grounds of Chelsea Hospital, on the initiative of Mr. E. A. Bowles, the Council agreed to put aside £250 as a nest-egg for the work in question, and thenceforward several sums in succession were added. In our own pages, in the issue for April 10, 1915, Mr. Gerald Loder contributed an article of some length on the same topic, and gave an account of the author of the invaluable *Icones Plantarum*, to which we may refer our readers. Meanwhile, the need for a new edition, including the numerous additions of more than half a century which has elapsed since the issue of the second volume in 1866, was becoming pressing; the question was, How was this demand to be met?

In November, 1917, two committees were constituted by the Council of the Royal Horticultural Society, one to advise on the amount of information which those for whose benefit the revision would be mainly undertaken would wish the new Pritzel to include; and the other to report what information would be considered possible to include, in the opinion of those familiar with the preparation of such works. Both of these committees have grappled with their assigned tasks, and have compiled a practicable method which may be briefly cited.

The extant "Index" is to be the basis, and all botanical illustrations of value are to be included, even of some intentionally omitted by Pritzel himself, but under the names employed in the given publication, with the addition of such cross-references to changes in nomenclature as may be found feasible without exceeding the means and the time available. It would need the help of an army of experts to carry out the claims of some people, and even then their determinations might be challenged by other experts equally entitled to credit. Printer's errors and obvious slips can and will be set right, but the "Index" sets out to do that and no more; it will guide the searcher to the figures ostensibly those required; after that, the skill of the expert comes into play. Hybrids will be included, but the numberless garden forms, many of which are of multiple origin, are to be left out. That is the present intention; but if the Fellows and subscribers desire "Florists' Flowers" to be included—the numerous named Tulips and Pelargoniums or Roses—it could be achieved, but the additional labour and consequent cost will be very greatly increased, possibly doubled; but further consideration of this point must be postponed.

The compilation was started last autumn under the honorary directorship of Dr. Stapf, F.R.S., keeper of the Herbarium and Library of the Royal Botanic Gardens, Kew. In that library there already exists a copy of Pritzel, and the additions noted since 1865 have been carefully typed into volumes easy to consult. Through the kindness of the Director, Sir David Prain, the requisite accommodation has been provided in the library at Kew for the staff workers, under the eye of the keeper, the Honorary Director of the new venture. The script for the printers is being typed by clerks familiar with botanic literature, and a set of cards is at the same time being prepared for card cabinets as a permanent record, to be placed in the library of the Royal Horticultural Society, where it can always be kept up to date for consultation.

The original work contained about 107,000 entries, and it has been estimated that at least an additional 125,000 will have to find a place in the new edition. A rough estimate of the cost of preparing the MS. for the printers has been made of £1,500, not including the proof-reading; add to this the cost of printing, of late so seriously enhanced, and it will be seen that a great task has been taken in hand. The Council, however, has been encouraged by a liberal response to its appeal to the Fellows for special help, and there can be no doubt that the edition will be eagerly taken up and bought by the public. It must not be forgotten that assistance has been promised by the United States, and that a large public exists on the other side of the Atlantic who readily buy volumes which appeal to them, as we believe this will do.

It may be asked, "How does this undertaking appeal to the Horticultural world? Admittedly, botanists will find it useful in a high degree, but cultivators are hardly likely to need the kind of information contained within the covers of the new 'Index.'" This appears to be a mistaken view; within the last twenty or thirty years, the love of gardening has spread widely, and has been more thoroughly and intensely studied than before. Many gardens throughout the United Kingdom have been enriched by their owners benefiting by the gardening Press, and constantly reference is made to illustrations for confirmation of naming, or for information of the flowers or fruit of a plant or shrub which has still to develop. Consider the multitude of admirable drawings which have been published in the pages of *The Gardeners' Chronicle* during the past sixty or seventy years, and the "Index" will afford a quick and ready means of turning up the page where a figure of the plant in mind is to be found, even though it mentions other figures for the moment out of reach.

Although Pritzel in his preface speaks of his "Index" as having "no prototype," we have in our own literature something which may be looked upon as the first attempt in a department which has now grown so enormously. In the second edition of Dr. Withering's *Botanical Arrangement of British Plants*, issued at Birmingham in 1787, there will be found under each plant a series of references to the iconological literature then existing, which was compiled by Dr. Jonathan Stokes. Comparatively few coloured plates were then accessible, so that the woodcuts of the old herbalists were largely drawn upon for citation. In passing we may call attention to one excellent feature of Dr. Stokes's work; that is, he carefully points out where a certain figure is reprinted elsewhere, and where it is copied; besides this, he offers critical remarks, comparatively easy then having only British plants to deal with and a modest array of illustrations. It must be remembered that even the veteran *Botanical Magazine* was only starting on its long career in the same year, 1787. Our previous remarks testify to the remarkable increase of figures during the past fifty years, therefore we look forward in the hope that before long we shall have the gratification of beholding the modernised "Index" issued by the Royal Horticultural Society.

The Surveyors' Institution.—The next ordinary general meeting of the Surveyors' Institution will be held in the lecture hall of the Institution on Monday, the 31st inst., when a paper, entitled "Building Contracts Before and After the War, and the Functions of the Quantity Surveyor," will be read by Mr. John W. Hurrell (Fellow). The chair will be taken at five o'clock.

Lectures on Food Problems.—Professor Henry E. Armstrong, F.R.S., will deliver a series of three lectures on "Problems of Food and Their Connection with Our Economic Policy" on Monday afternoons, March 31, and April 7, and 14, at half-past four o'clock, before the members of the Royal Society of Arts, John Street, Adelphi, London, W.C.2. The object of the course is "to discuss present knowledge of foodstuffs—their character, functions, and assimilation—and to consider the directions in which our dietic policy is open to criticism and improvement and should be taken into account in determining agricultural practice and our economic policy. The effect of faulty feeding on public health will be specially considered, also the problem offered by vinous beverages."

Mr. George Bacon Mallett.—In the issue for September 26th, 1914, we published a letter from Mr. Mallett, written from the Bristol Battalion, Gloucestershire Regiment, stating that he had suspended his Cheddar nursery business for the period of the war. "All the eligibles of my nursery and contracting staff are with me in the Army for the period of the

war, old men alone being left at home to keep things alive till our return from active service abroad." He now writes: "I have survived the war, am demobilised, and anxious to pick up the threads of the business I relinquished to join Kitchener's Army in 1914." Mr. Mallett's many friends in the horticultural world will be delighted to know that he has passed through the terrible times safely, and we trust that the old men were able to "carry on" during their patriotic master's absence, so that he will find plenty of business awaiting him. Such men as Mallett made great sacrifices for their country in the most critical days of the war.

Dendrobium speciosum nitidum.—The central specimen in the fine group of Dendrobiums staged by Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Surrey, at the meeting of the Royal Horticultural Society on the 11th inst., was the fine plant of Dendrobium speciosum nitidum, illustrated in Fig. 64. D. speciosum, all the varieties of which are to be found in Queensland, is a very variable species, and those who know only the stout and commonest form in gardens, and the less plentiful, taller-growing D. speciosum Hillii, both with their dense spikes of creamy-white flowers with some purple markings on the lip, would scarcely realise that the rarer and more slender-growing Bancroftianum and nitidum are but varieties of D. speciosum. Much as these plants may differ in habit, however, there is no structural botanical feature either in growth or flower to warrant their separation as distinct species. In the case, however, of D. fusiforme (see Fig. 65), which was originally described by F. M. Bailey (*Synopsis of the Queensland Flora*, page 509) as D. speciosum fusiforme, the very different shape of the pseudo-bulbs later decided the author to remove it from D. speciosum and name it D. fusiforme. In gardens the various forms are easy to cultivate and very free flowering, the old kinds being very often found thriving in warm conservatories, vineries, or warm greenhouses where they obtain plenty of air and sunlight, conditions which are essential to all the species of the group to ensure the full production of their flowers. The variety nitidum varies in the tint of its flowers from cream-white to greenish-yellow in the mature stage. The plant illustrated was imported with other species by Sir Jeremiah Colman. It has been shown several times at the Royal Horticultural Society, and received a Botanical Certificate in 1910 and a Cultural Commendation in 1913.

Fig. 64.—A fine plant of Dendrobium speciosum nitidum.

Food from Back Yards and Gardens at Leyton.—In the densely populated district of Leyton the school authorities appealed to the boys and girls to cultivate their back yards and gardens. A report on the work of the year just ended shows that over 3,000 cultivated their own plots, while more than 2,500 helped on allotments. Potatos, Cabbages, Turnips, Carrots, Parsnips, Radishes, Onions, Cauliflowers, Runner Beans, Beet, Sweet Herbs, Leeks and Sprouts were among the vegetables grown, and large quantities of food were obtained. As a rule the children were well pleased with the results, and are most eager to continue their efforts. One headmaster purchased seeds to the value of £4 3s., and sold them in penny and halfpenny packets. He has already received requests for 1,649 packets for this year. In most of the schools information and advice were freely given, difficulties discussed, and the children instructed in the method of combating pests. A case is reported of a boy aged 13 years, who, during the absence of his father in the Army, cultivated the garden and an allotment, and the produce he grew sufficed for the whole family of seven.

Tenure of Allotments in the London Parks.—In reply to an inquiry respecting the tenure of the allotments provided in parks and other spaces under the control of the London County Council, the Parliamentary Secretary to the Board of Agriculture has written as follows:—"Dear Sir,—In reply to your letter of the 22nd ult. as to the tenure of allotments, I have to say that my reply to the questions on the subject in the House of Commons on the 17th ult. referred to land of which the Board of Agriculture and Fisheries have taken possession under the Defence of the Realm Regulations. In providing allotments in the parks and open spaces the London County Council were dealing with land already in their possession and under the special provision in the Defence of the Realm Regulations No. 2 L, enabling them to arrange for the cultivation of the land on their own behalf and at their expense, and the Board do not consider that they are in a position to override the exercise by the County Council of their discretion as to the period for which the land shall continue to be used for allotments. I may add that the decision of the Council to terminate the tenure of the allotments in the parks and open spaces at the end of the present year appears to the Board to be reasonable, as nothing but the stress of war conditions could have justified the use of the parks and open

spaces for this purpose, and when the war is over it is only reasonable that the land should be restored to the use for which it was acquired. In view of the great demand for additional land for games and recreation, the Board do not feel that they can press the London County Council to allow a small minority of the ratepayers to monopolise the use of land which was provided for the benefit of all, and to which all ratepayers have to contribute.—Signed A. G. Boscawen.

Prices of Nicotine.—Manufacturers of nicotine have agreed that the maximum price to be charged for nicotine to the grower or manufacturer of compound washes up to the 30th June next is 16s. per lb., 95 to 98 per cent. purity, for 100lb. lots, delivered to purchaser's nearest railway station, and 16s. per lb. f.o.r. for sales of less than 100lb. lots. Prices for nicotine of lower purity are to be proportionate. Buyers of nicotine are required to give an undertaking, in writing, that any nicotine purchased by them will be used solely as an insecticide for their own crops, or in the manufacture by them of compound washes for re-sale.

The Flora of a Single Tree.—The remarkable richness and variety of the epiphytic vegetation of tropical and sub-tropical forests is illustrated by the records* obtained by Messrs. Longman and White from the botanical survey of a single recently felled tree in the sub-tropical rain-forest of the Tambourine Mountain (Queensland). The tree subjected to investigation was a specimen of the Lauraceous Litsea reticulata or Bolly Gum, a tree used locally for building purposes. Chief among the epiphytic species were the large Bird's Nest ferns (Asplenium Nidus) which grew side by side with the Elk-horn's (Platycerium bifurcatum and P. grande), and the Hare's-foot fern (Davallia pyxidata) and the so-called Rock Lily (Dendrobium speciosum). Large vines of the semi-parasite Loranthus celastroides were in full flower, and on them was "a plant of the hyper-parasite" Notothixos cornifolius var. subaureus—the Golden Mistleto. Two Apocynaceous creepers—Chilocarpus australis and Parsonsia velutina, embraced the branches, together with the Liliaceous climber Rhipogonum elseyanum. In the branches in a fork cavity was a thriving specimen of Pithecolobium grandiflorum, a tree which could not permanently find room for its development in such a restricted soil medium. Seven species of Orchids flourished on this hospitable Bolly Gum, and all except Cleisostoma tridentatum which habited on slender branchlets, were attached to the main trunk or main branches. With the Orchids were nine Ferns. The Orchids were Dendrobium speciosum, D. tetragonum, D. teretifolium, D. gracilicaule, a species of Sarcochilus and the aforementioned Cleisostoma. Beside the Ferns already enumerated were found Anthropteris tenella, Asplenium adiantoides, Vittaria elongata, Polypodium pustulatum and Cyclophorus serpens. In all, fifty plants were found growing epiphytically on the single tree.

* *The Flora of a Single Tree. By H. A. Longman* and *C. T. White. Proc. Roy. Soc. Queensland*, XXIX, 6. 1917.

Fig. 65.—Dendrobium fusiforme; flowers cream white. (*See page* 155.)

Prizes for Potatos.—At the National Potato Exhibition to be held at Birmingham in November, 1919, Messrs. Sutton and Sons, Reading, will offer the sum of £100 in prizes, in classes for several of their specialities in Potatos. The sum of £60 will be offered in ten first prizes and £40 in others. During the past forty years Messrs. Sutton and Sons have been pioneers in the introduction of heavy cropping, disease-resisting varieties, a number of which are immune from wart disease. Particulars of the classes in which the prizes named above are offered may be obtained from Mr. W. G. Morter, Hon. Sec. National Potato Exhibition, Council House, Birmingham.

HOME CORRESPONDENCE.

(*The Editors do not hold themselves responsible for the opinions expressed by correspondents.*)

The Recent Severe Weather and Plant Life (see pp. 115 and 129).—The temperatures recorded by the three writers on this subject seem almost incredible for such a short cold snap as we had last month, and it would be interesting to learn how they compare with the records in the same districts for the long frost of Feb.-Mar., 1917. On the latter occasion, my thermometer, which is on a window-sill facing N.E., registered decidedly lower temperatures by 4 or 5 degrees than it did this year in the same position; but to the best of my recollection it never went below about 18° (*i.e.*, 14° of frost in 1917. *C. Nicholson, Hale End, Chingford.*

Birds in the Garden.—I was much interested in the article on "The Study of Wild Birds" in your issue of March 15th. Some five or six years ago owing to the serious destruction of fruit buds on my Plum-trees, I covered in with ¼ inch wire netting alternate trees, only taking the top netting off when the fruit was well set and replacing it after the crop had been gathered. I continued the experiment for three years, and found that there was no appreciable increase of fruit in the netted trees in comparison with the unprotected trees. A neighbour of mine tried the same experiment, with the same result. Is it possible that the birds only attack fruit buds that have some grub in them and which would never produce fruit? *W. Cameron Gull, Frilsham House, Yattendon, Berkshire.*

Women in Horticulture (see page 77).—*W. W.*'s remarks on "Women in Horticulture" were very interesting reading, and the facts so eloquently described ought, I think, to bring forth very strong comments from some of our leading professional gardeners. If something is not done very soon the professional gardener will soon be extinct, and will be finally supplanted by the class your correspondent describes as "our gardener." Not for a minute do I impute that "our gardener" is not a practical man, but is he a professional man? The difference between practical and professional men in the sphere of horticulture is, in my opinion, very great, and a wide gulf divides the two. Now that the war is over, it is a fit time to try and bring professional horticulture to the front again—a very difficult task to accomplish. The only way I can see to do this is by organisation, and I think that if our professional men would only unite and pull together there is yet time to save the gardening profession from sinking below that of the ordinary agricultural worker. The work of a gardener is, in most cases, away from the centre of industrial communities. He may be quite near to, but not actually amongst, his fellow-workers whose calling is in a different sphere of life, and therefore he does not know their working conditions. Those of us gardeners who have worked on food production schemes during the war, actually amongst other classes of workers in some of the largest industrial centres of England, know what organisation has done for them—not, do I mean, during strikes, but helping them to get proper and fair conditions under which to work. The gardener of to-day—even the "professional"—cannot say that the conditions under which he works are fair and proper. Are we to wait (as 'our correspondent nearly suggests) until there are sufficient lady gardeners to force employers to alleviate our position? Cannot something be done by Act of Parliament to have all horticultural workers recognised, as has been done in the case of agricultural workers? *W. P.*

Spraying for Big Bud Mite.—It is interesting to learn from the Long Ashton experiments (see page 141) that big bud mite (Eriophyes ribis) may be controlled by using a mixture consisting of 10 per cent. of soap and 5 per cent. crude carbolic acid, particularly if the spraying is applied twice or thrice. This mixture will kill the mites without doubt, but it appears to me that the season recommended for applying it is too early. The member of the family of Eriophyidæ which causes so much damage to Black Currant bushes is one which is very easily killed, and any ordinary

insecticide will soon exterminate the pest. Black soap and compound Quassia extract are both fatal to the mite, but both are absolutely useless unless they be applied at the actual period of migration. Mr. A. H. Lees recommends that the first spraying should be done at the beginning of December, and the later sprayings in January and February I cannot understand such a recommendation, and would ask what purpose is served by spraying during these months? I am not aware, of course, of the climatic conditions that prevail at Long Ashton during the months in question, but the mites certainly do not venture out in Scotland until much later in the season. Migration does not begin properly in this district until about the beginning of April, but it is a circumstance that is wholly governed by the weather. This year, for example, we had a particularly fine spell of warm weather and genial sunshine towards the end of the second week in March. I watched the bushes very carefully, and could detect no movement on the part of the mites up till March 8. The magnifying glass failed to reveal any sign of life on the branches, but a week later, encouraged, no doubt, by two days of remarkably fine weather, I found some mites on the move. These mites would perish, for two or three days later we had a very cold spell of north wind and snow, which we are still experiencing at the time of writing. The beginning to the middle of April is the time when migration begins in earnest; and it has been my practice to begin spraying at the end of March and to continue doing so once weekly until the first week in June. The bushes so treated are absolutely devoid of mite, and consequently are free from big bud. The variety is Boskoop Giant. Half of the bushes are sprayed with quassia extract at the times indicated, and the other half is left unsprayed. This is done purely for experimental purposes, as we are testing an alleged immune variety amongst the infected bushes, and it is a remarkable fact that the sprayed bushes are free from mite, whilst the other half which is unsprayed is badly infected. The main thing is to catch the mites when on the move, and their destruction and complete eradication is then a very simple matter. I am familiar with the details of the life history of this mite, which have been worked out by Collinge, Embleton, Lewis, and Warburton, and I cannot see what good can possibly result from spraying in December, January, and February. Even if the mite ventured out during these months—and I question that very much—it would, in Scotland at least, perish from the results of exposure. I quite agree with what Mr. Lees says in regard to reversion in Black Currants, and his experiences coincide exactly with my own in this respect. I cannot, however, follow him in so far as the migration of the mite is concerned, and I cannot see any necessity for wasting time in spraying during the months of December, January, and February. *George M. Taylor, Edinburgh.*

Tomato Seedlings Damping Off (see page 142).—I do not presume to deny that Mr. Spinks has found Phytopthora on the stems of young Tomato plants, but that this fungus is the general cause of damping off is open to doubt. According to my experience the damping does not occur in the seed pan. Seedlings raised singly in pots are not subject to it, neither are plants which have become well established and are rooting freely. It only occurs during the winter when the nights are cold, and it is not infectious. With the exception of those already attacked the disease disappears when the plants are growing freely. An odd seedling here and there may collapse when the plants are repotted in 5 inch pots, but that may be accounted for by the fact that the stems are very soft at the time, and are frequently buried an inch or two below the former surface. It is true a fungous growth may be found on the affected stems, but that is a consequence and not the cause of the mishap. If Phytopthora is the culprit, why should it not continue to affect the plants to the end when we know how much this fungus and its allies delight to flourish on the class of plants to which the Tomato belongs? The damping off occurs when the little plants are transferred to fresh soil and before root action has recommenced. If the plants are in an unvarying stove temperature until such time as they are rooting freely they will most likely escape, but should the temperature fall rather low, and remain so sufficiently long for the soil to cool, condensation will take place on the surface, and although the atmospheric temperature may rise rapidly on a sunny morning it will be some time before the soil becomes sufficiently warm for the moisture to be dispersed. Under such a contingency an early application of water heated to 90° will be likely to prevent injury. It is a good plan when sowing seeds in winter to place two or three in a small pot, and allow only one plant to remain. The pot should be only half-filled at the time of sowing, and more soil added when the plant is sufficiently high to allow it. When raised from seeds sown in pans or boxes I prefer, when potting, to place the plant close to the side of the pot, for it commences to grow more quickly than when placed in the middle. Seedlings should not be potted too soon. They should be allowed to make at least two leaves beside the seed leaves, when the roots will be in a position to take hold of the soil quickly.—*Wm. Taylor, Bath.*

Gardeners' "Victory" Memorial (see pp. 115, 129, 144).—The remarks of Messrs. Beckett and Cranstone deserve the most serious consideration of horticulturists. I consider Mr. Beckett's suggestion of placing a tablet on the garden wall worthy of the consideration of all employers. True, men may come who know not the fallen heroes, but that is all the more reason why their memory should be kept fresh in the minds of coming generations. The suggestion was decided upon by my employer some time ago. That probably would not seem such a noble memorial as, say, a tablet placed in the Hall of the Royal Horticultural Society, but from the local interest taken in gardens generally I think the former would be the most suitable. While we talk about memorials to the fallen, would it not be also a very great matter to remember the living and try to do something for the widows and orphans of the men who so nobly fell in defence of their country. Much has been written and much money has been collected with the intention of assisting the replanting of devastated areas in the war-stricken countries. A very good purpose, truly, but I think that charity should, even in this case, begin at home, and our first consideration should be for those amongst us who have suffered and are still suffering. No doubt a grateful country will make a certain provision for widows, and children may receive a pittance for educational purposes. Some employers have dealt very generously towards widows and their children. Those of us who were spared the hardships of war and also the men who donned khaki and returned in safety should try and do something for the less fortunate. If the Royal Agricultural Society, in conjunction with the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund, would take up this subject a considerable advance would be made in the way of doing something for those left behind. Were the Royal Horticultural Society to appeal to its Fellows and Associates, as well as Affiliated Societies, for a donation towards such a noble purpose I feel assured it would find a speedy and satisfactory response. Probably a meeting could be arranged on one of the days of the Chelsea Show, when the matter could be discussed and while green in our memories we could set on foot a truly worthy Gardeners "Victory" Memorial. *C. Shaw, Torgswood Gardens, Hawkhurst, Kent.*

Sparrows and Winter Moth Larvæ.—Mr. J. G. Blakey (pp. 119-20), in coming to the conclusion that the sparrows he saw picking Winter Moth larvæ from fruit-buds were not doing much good, because the larvæ, being nearly full-grown, had already done the damage they could, overlooks the fact that every larva so devoured meant one less moth for the next winter, with the consequent reduction in the number of larvæ the following spring. Although sparrows undoubtedly do a fair amount of damage in some places, I utterly decline to subscribe to the idea that they are wholly injurious: there are many instances on record in which they have achieved wonders in reducing—and sometimes annihilating—disastrous insect plagues. Even wood-pigeons are not wholly black!—*C. Nicholson, Hale End, Chingford.*

Gardeners' Hours and Wages (see pp. 128, 144).—Mr. Charles E. Pearson considers I spoil my case by asking full wages for employees at 13 years of age. I disagree with him, for my contention is that if a lad of 18 years is old enough to fight for his country and receives the same Army pay as the man of any other age, he is entitled to full wages and benefits in the labour world. Mr. Pearson may say boys of 18 years have not been fighting. This may be true since June 29, 1916, but when I joined the Army on September 5, 1914, we had lads of 17, 17½ and 18 years, whose conduct and endurance were equal to that of men of older age. Mr. Elwes must surely have been sleeping for the past 50 years. He states that no union can force employers to employ its members or to pay them more than they can afford for what is a luxury, more than a necessity, in a great many places. The word luxury seems to be the one and only term that those who seem to be against the emancipation of the members of our profession can use. Actors and actresses, who cater entirely for amusement, have a union which manages to control wages, hours and conditions. Even domestic servants are, at the present time, demanding fixed hours, minimum rates, time off duty, and heaps of other reforms. Yet, in spite of the fact that in every walk of life people, including clergymen, doctors and policemen, are forming and joining trade unions, gardeners, as a whole, are still existing under miserable conditions. Taking next the question of forcing the employer to employ only union men and pay union rates, Mr. Elwes writes that fewer gardeners will be employed owing to the cost of upkeep. Well, what of that? Is it not better that the rising generation should cease to be exploited by the private employer for his pleasure, and enter industry where he can still maintain his self respect and through his union control his hours and wages? When he mentions Glasgow and South Wales does he mean that in reality and against his desires they are more enlightened than the average gardener? If that is what he means I quite agree. The South Wales miner and the Glasgow workers are out to make life worth living for the labouring classes. Mr. Elwes further states that in many country districts there are many old men, boys and women not capable of a full day's work, etc. Yet, further on, he states "without regard to fixed hours," which only means, in my opinion, longer hours than 48. But this is quite a new line to take. My experience of country districts and the workers are that they can beat the average town-bred man, boy or woman for endurance and hard work. Gardeners were not sent to give pleasure entirely to the wealthy. The very man who employs gardeners at a fearfully low wage and long hours is, in all probability, made to pay the full trade union rates in his works in another part of the country. Large numbers of gardeners are greatly dissatisfied and are ready to fight for what is justly theirs. In my opinion, there is only one way to get it, and that is to join a union, not a gardeners' union, but a union like the Dock, Wharf and Riverside and General Workers', or the National General Workers'. When I read such remarks as those of Mr. Elwes about the employers' friendly spirit of consideration, and view the past and present experience of myself and those I have come in touch with, it makes me sick of such twaddle. If the wealthy want beautiful gardens, flowers, fruit, etc., let them pay to the full, as they have to for their race-horses and race-gowns, their house-boats and motor-cars, trips abroad and boxes at the theatre. If they are not prepared to pay, it would be better to close the garden and let labour seek its level in some other sphere. *H. Chivers.*

Publications Received.—***Dung Heaps and the Preservation of Farmyard Manure.*** Board of Agriculture and Fisheries. Food Production Leaflet No. 60.

SOCIETIES.

ROYAL HORTICULTURAL.

MARCH 25.—In spite of bitterly cold weather, there was a good attendance at the London Scottish Drill Hall, Westminster, on the occasion of the R.H.S. meeting on the above date. The principal floral features were Orchids, Azalea mollis, Rhododendrons, Saxifragas, and Daffodils.

The Floral Committee granted two Awards of Merit and Medals; the Orchid Committee recommended three Awards of Merit, two Preliminary Commendations, and awarded four Medals to groups; the Narcissus Committee granted two Awards of Merit and three Medals; the Fruit and Vegetable Committee made no award.

The subject of the afternoon lecture, delivered by Mr. Edward White, was "The Study of Economic Botany and the Professional Openings it Offers."

Floral Committee.

Present: Messrs. Henry B. May (in the chair), W. J. Bean, Sydney Morris, R. C. Notcutt, E. H. Jenkins, H. Cowley, W. B. Cranfield, John Green, John Heal, G. Reuthe, C. R. Fielder, W. Howe, A. Ireland, Thos. Stevenson, J. F. McLeod, J. W. Moorman, W. H. Page, C. Dixon, Arthur Turner, John Dickson, E. F. Hazelton, W. P. Thomson, Chas. E. Shea, F. Page Roberts, H. R. Darlington and J. W. Barr.

AWARDS OF MERIT.

Freesia Pinkie.—This new variety has neat, shapely flowers of modest size, coloured soft, bright pink, with some yellow in the interior of the paler tube and occasionally a small yellow mark on one of the segments. We could not detect any fragrance in the flowers.—Shown by Rev. J. JACOB.

Saxifraga lilacina.—A charming species belonging to the encrusted group, its densely clustered tiny leaves resembling little mounds of grey-green rock. The flowers, borne singly on short stems, are ½ to ¾ of an inch across, and of a rich, rosy-lilac colour. The species appears to flower quite freely, and it is certainly very effective.—Shown by R. TUCKER AND SONS.

GROUPS.

The colouring in the group of Azalea mollis varieties exhibited by Messrs. R. and G. CUTHBERT was very fine and reminiscent of the gorgeous displays this firm used to make at Temple shows. A few standard Forsythias formed a background, but the freely-flowered dwarf plants of Azaleas Nicholas Beets, Frans Van der Bom, T. J. Seidel (vivid orange), Fairy Queen, and the golden Hortulanus Witte, were most admired (Silver Flora Medal). The sweetly scented Viburnum Carlesii was well shown by Messrs J. PIPER AND SONS, with Saxifrages in variety, Juniperus pachyphlaea, and hardy Cyclamens (Bronze Flora Medal). Mr. G. PRINCE had a charming group of freely flowered branches of the yellow Banksian Rose and a few blooms of Fortune's Yellow (Silver Banksian Medal). Messrs. H. B. MAY AND SONS showed Ferns, Genistas and Cinerarias (Silver Banksian Medal), and Messrs. J. PEED AND SONS exhibited Cyclamens (Bronze Banksian Medals).

Messrs. ALLWOOD BROTHERS exhibited capital blooms of perpetual flowering Carnations, their leading varieties being Beacon, White Enchantress, Destiny, Mary Allwood and May Day; the flowers were of fine colour (Silver Banksian Medal). A gorgeous grouping of Rhododendrons from Messrs. R. GILL AND SON gave evidence of warmer weather at Falmouth than in London. With the R. arboreum varieties and the large-flowered Himalayan hybrids were branches of Magnolia conspicua, Erica arborea and the exquisite Andromeda japonica (Silver Flora Medal).

Little drifts of Saxifraga Burseriana Gloria, S. L. G. Godseff, S. apiculata, S. oppositifolia, Primula denticulata and Morisia hypogea made up a charming group from Messrs. JOHN WATERER, SONS AND CRISP (Silver Banksian Medal). Messrs. R. TUCKER AND SONS exhibited a capital lot of Saxifragas, and here the red S. Bertolonii, S. lilacina, the blush S. Irvingii, the rosy S. kewensis and the brilliant S. Griesbachii, very fine, were some of the rarer kinds (Silver Flora Medal).

Mr. G. W. MILLER again displayed spring flowers extensively, and showed Polyanthuses in a wide range of colouring, with Daffodils, Hepaticas and Crown Imperials (Bronze Banksian Medal). Messrs. J. CHEAL AND SONS showed hardy Primulas and Rhododendrons, and Mr. G. REUTHE staged Sarcococca humilis, somewhat like a Cotoneaster in growth; and Vaccinium Mortinia (Bronze Banksian Medal).

ORCHID COMMITTEE.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), W. Bolton, W. H. White, Arthur Dye, C. J. Lucas, J. Charlesworth, W. H. Hatcher, E. R. Ashton, Pantia Ralli, T. Armstrong, A. McBean, Fred Sander, Walter Cobb, Stuart Low, S. W. Flory, Frederick J. Hanbury and R. A. Rolfe.

AWARDS OF MERIT.

Laelio-Cattleya Queen Marie (L-C. Goldfinch × D. Empress Frederick), from Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. Collier). A handsome hybrid, retaining the form of the large-flowered Cattleya and with finely expanded lip. The sepals and petals are clear rose colour; the broad lip ruby purple in front, with gold lines extending from the base to the yellow blotches on each side of the tube.

Odontoglossum St. André (Oda. Sanderae × Odm. Amabile), from SANDERS, St. Albans. One of the best of its class, the flowers being large, of very bright colour and effectively displayed. The ground colour is pale yellow, heavily blotched with bright red, the yellow ground showing through the segments in wavy lines between the blotching.

Odontoglossum Vardar (mirificum × eximium), from Messrs. FLORY AND BLACK, Slough. A distinct flower of excellent shape. The ground is white, richly blotched with claret red, the white margin being clearly defined. The lip, which is exceptionally broad, has purple markings in front of the yellow crest.

PRELIMINARY COMMENDATION.

Odontoglossum Pallas (illustrissimum × Doris), from Messrs. FLORY AND BLACK. The third member of a very pretty batch shown by this firm. The variety Pallas has large flowers, spotted over the greater part of their surface with claret red, thin white lines showing between the blotches.

Odontioda Cyclops (see fig. 66) (*Oda. Bradshawiae × Odm. Mars*), from Messrs. ARMSTRONG AND BROWN, Orchidhurst, Tunbridge Wells. A grand new hybrid with broad sepals and petals of a rich red colour, with a decided gold shade and very slight white margin. The lip is light lilac with red blotches in front of the yellow crest, and there is a narrow band of purple markings inside the margin.

OTHER EXHIBITS.

Sir JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. J. Collier) staged a pretty group of Gatton hybrid Dendrobiums and other hybrids raised at Gatton, the finest of which was Brasso-Cattleya Gatton Lily var. magnifica, the largest of the satisfactory batch, two of which have recently secured First Class Certificates; a brightly-coloured selection of Sophro-Laelias and Sarcochilus Hartmannii were also included.

Messrs. CHARLESWORTH AND Co., Haywards Heath, were awarded a Silver Flora Medal for a very effective group of Odontoglossums, Odontiodas and Laelio-Cattleyas. Two very fine hybrids were Odontoglossum crispo-Solon, with large and finely blotched flowers, and the best form of Odontioda Schröderiana (Oda. Bradshawiae × Odm. crispum) yet shown; the flowers are large and of perfect shape, the inner parts of the segments being orange red.

Messrs. STUART LOW AND Co., Jarvisbrook, were awarded a Silver Banksian Medal for a group of Laelio-Cattleyas, the fine L-C. Luminosa aurea, with yellow sepals and petals, and dark purple lip; and a very dark L-C. Dominiana being prominent features. The large-flowered Cattleya Cyrus and various bright Sophronitis crosses were included, together with a good selection of Dendrobiums and Cypripediums.

Messrs. J. and A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a finely flowered group of Cymbidiums, good forms of Laelio-Cattleva Beatrice and the white Cattleya Cowaniae alba. An interesting exhibit was Adaglossum nanum (Ada aurantiaca × Odm. Phœbe), a dwarf plant with narrow segments to the orange coloured flowers, which are spotted with dark purple.

Messrs. SANDERS, St. Albans, were awarded a Silver Banksian Medal for a group of showy Odontoglossums and Odontiodas, including hybrids, the new Odontioda Rajah, having large, dark violet flowers with slight white markings, and the rare and pretty Odontoglossum naevium.

FIG. 66.—ODONTIODA CYCLOPS.
(See awards by the Orchid Committee.)

Messrs. Armstrong and Brown, Tunbridge Wells, showed a fine selection of new hybrids, including the handsome Odontoglossum Ajax (amabile × promerens), a grand cream white flower tinged with pale yellow and bearing effectively-arranged clusters of spotted lines and blotches of claret red. The lip is white, with small red markings around the yellow crest. O. Ajax Armstrongiae, broader in all its parts than the preceding, white, blotched in the inner half with ruby-red. Odontioda Ariadne (Oda. Coronation × Odm. Conqueror) of Odontoglossum size and shape, white blotched with Indian red, the front of the lip being white; and Odontioda Jupiter (Oda. Coronation × Odm. eximillus), a large flower, claret red with a few white markings in the margin and bases of the petals. A plant of Sophronitis grandiflora had eighteen brilliant scarlet flowers.

E. R. Ashton, Esq., Broadlands, Camden Park, Tunbridge Wells, showed a selection of good Odontoglossums and Odontiodas, a very dark maroon form of Odontioda Joan being specially noteworthy.

Messrs. Flory and Black showed the new pure white Cattleya Princess Ileane (Myra Peeters × Luddemanniana alba), a very attractive flower.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), showed Miltonia Bleuana Hessle variety, a pretty clear white form, with violet mask on the lip.

Narcissus and Tulip Committee.

Present: Messrs. E. A. Bowles (in the chair), F. H. Chapman, H. Hawker, H. Smith, H. V. Warrender, F. Barchard, Peter R. Barr, G. Reuthe, W. Poupart, G. W. Leak and W. B. Cranfield, Miss Willmott, Rev. J. Jacob, Rev. C. T. Digby, and C. H. Curtis (Hon. Sec.).

Awards of Merit.

Narcissus Buxted.—A very finely proportioned Trumpet variety of large size. The trumpet is light golden yellow and the spreading mouth is neatly frilled. The wide perianth segments are soft yellow and of fine substance. This variety is like a glorified Lord Roberts, and it is one of the late Mr. Haydon's seedlings. Shown by Messrs. R. H. Bath, Ltd.

Narcissus Golden Cycle.—An effective hybrid presumed to have been derived from Golden Spur crossed with Narcissus cyclamineus. It has stems 12 to 15 inches high, stiff foliage, and golden yellow flowers about the size of those of N. Johnstonii. The trumpet is fairly straight and suggestive of N. cyclamineus, and it has a frilled mouth. The perianth segments are reflexed. The plant does well in pots, and the form of the flowers render it suitable for the rock garden. Shown by Capt. Hawker, Strode, Ermington, Devon.

Groups.

The largest group in the hall was one of May-flowering and Darwin Tulips, grown in fibre, in bowls, and staged on the floor by Messrs. R. H. Bath, Ltd. A few bowls were raised a little above the general level. The flowers were well developed, but they did not like the cold weather. Leading varieties included Feu Brilliant, Gesneriana lutea, Orion, Euterpe, Mr. Farncombe Sanders, Bouton d'Or, La Candeur, and Mrs. Moon. Bunches of Chionodoxas were grouped at the end of the exhibit, facing the entrance to the hall (Silver-gilt Banksian Medal).

The small group of choice and finely developed Daffodil blooms shown by Messrs. R. H. Bath, Ltd., was greatly admired; The President (of King Alfred type), Sunrise, Refulgence (very bright), Lady Mayoress (white), Silver Dawn (giant Leedsii) and Croesus (with a vivid orange cup) were a few of the superb varieties shown (Silver Flora Medal). Messrs. Barr and Sons showed a collection of cut Daffodils, and among their special varieties we noted Peter Barr, Uncle Robert, some King Alfred seedlings, Phineus, a very richly coloured Barrii form, Blazing Star, and Ulysses (Silver Flora Medal). Capt. H. Hawker, Strode, Ermington, Devon, showed a few seedling Daffodils and two pots of the charming Narcissus Golden Cycle.

Fruit and Vegetable Committee.

Present: Messrs. J. Cheal (in the chair), G. F. Tinley, W. Bates, W. Bullock, W. Poupart, P. C. M. Veitch, James Vert, W. H. Divers, F. Jordan, A. R. Allan, Geo. P. Berry, A. E. Fidler and Rev. W. Wilks.

The only exhibit before this Committee was one of several dishes of Potatos—King Edward, Drummond Castle, Edinburgh Castle, Sir John Llewelyn, Satisfaction and others—from W. G. Ridgen, Esq. (gr. Mr. J. Lingwood), Queenswood, Englefield Green. In most dishes the tubers were large, and in some instances they were rather coarse.

LEEDS AND DISTRICT MARKET GARDENERS' ASSOCIATION.

This Association held an Exhibition of Rhubarb on the 8th inst., at the Albion Hotel, Leeds. Prizes were offered in four classes; a cup, value 10 guineas, was offered by Messrs. Garcia Jacobs and Co., for the best three marketable bunches of Victoria Rhubarb, not to exceed ¾-lb. each, tied with ordinary material. The best six sticks of Prince Albert or Linnaeus variety were shown by Messrs. T. W. and H. Popplewell, Bramley; the best six sticks of Victoria by Mr. R. Driver, Bramley; the best six sticks of Daw's Champion by Mr. Sam Brook, Morley. The Silver Cup was won by Mr. A. Cowling, Tingley. At the close of the Show the exhibits were sent to the wounded soldiers at the Military Hospitals, Leeds.

CROPS AND STOCK ON THE HOME FARM.

Pigs.

The more I see of the markets and the prices obtained for pigs, the more I am convinced that pigs at the present time form one of the best paying things on the farm. Some twelve months ago people were getting rid of their sows owing to food shortage and other reasons, but I increased my breeding sows, knowing that there must be a scarcity of young pigs later.

Those who followed my advice at the time have cause for satisfaction. As giving an idea of how valuable store pigs are, animals twelve weeks old realised 78s. in the open market last week.

A litter of ten pigs at that age made £34; not a bad investment.

The point I would impress on all who intend to keep pigs is to obtain a good type of pig and attend to them well. Many persons think anything will do for a pig in the way of food or accommodation, and too many seem to think if the pigs are wallowing in mud they are flourishing. This is a mistake. Nothing is so desirable as dry, wooden sleeping quarters. Concrete is the worst of all for this purpose, for too often with concrete floors the young pigs are affected with cramp in their legs. Where skim milk is obtainable, as it is on farms where butter is made, the pigs drink this freely while quite young, grow rapidly, and look well in their coat, showing constant progress, that by the time they are weaned at seven weeks old they are strong animals. Some wean them first, and castrate the males after. This is, in my opinion, wrong. They should be left with their mother fully a week after that has been done, otherwise the young pigs receive a check to growth.

Many make mistakes in their management of the sows and boars, paying little regard to purity of breed. My practice is to obtain one cross only, as I consider by that means greater strength and a full development of the two types are obtained, which, I need hardly say, should be of a desirable character to effect the purpose in view. Having tried many breeds, I have come to the conclusion that no sort is better for general utility purposes than a cross between a large Yorkshire white sow and a middle white boar. From these we may expect on an average a litter of ten pigs, with a reduction in number as the parents get older. The progeny from this cross grow quickly, are shapely, having great depth of body to make desirable porkers, and sufficient length to produce bacon. Such a sow mated with a Berkshire boar would produce pigs equal in quality, but generally the young are fewer in numbers.

Calves.

We are advised by the Board of Agriculture to keep all heifer calves, with which I agree, especially on farms in grass counties, as the stocks of cows have of late been running very low.

The type of cow most desirable is purely a question of requirement. Where milk alone is the aim, no sort is so good as a well-bred shorthorn from a good milking strain; while some persons pin their faith to those of a light roan colour, others are equally keen on red and white or even self colours.

Colour is but one quality; result in milk is the main object. Where the dairy produce is intended for home use and high quality milk, cream and butter are required, then no breeds are so desirable as Guernsey or Jersey. While the latter may give milk and butter of slightly higher quality they are less hardy than the former, and not so profitably disposed of when their milking days are past; therefore I recommend the Guernsey, which is a first-class breed in every respect. For general utility purposes a cross between a short horn cow and a Jersey bull is very desirable, as such a cow gives a milk in bulk and of good quality.

Regular attention to the feeding of the calves from their birth naturally produces the best animals. I find the E.C.C. calf meal excellent; it is highly nutritious, and I have never known it to scour the animals, which is important. When this occurs with other foods it is generally traceable to an excess, which should not be given in fairness to the food as well as the welfare of the animals.

Scour in calves is detrimental to their growth, as a bad attack checks growth and lowers the condition of the animals, if it does not kill them. High quality meadow hay and linseed cake form a valuable food for calves. To maintain good shape in the animal it is not wise to turn them out on grass until they are at least six months old; even longer would be all the better. An airy yet warm shed or barn free from direct draught is an advantage, so that the animals can have exercise at will. *E. Molyneux.*

Obituary.

H. E. Wallis.—It is with regret that we record the death of this well-known exhibitor of first-rate vegetables. Mr. Wallis will be remembered for the excellent collections of vegetables which he contributed to the R.H.S. meetings. Probably his best effort was that of September last, when at the annual show of British-grown vegetables he set up such a splendid non-competitive exhibit as to win the highest honour of a Gold Medal. This medal, by the irony of fate, was received by his widow two days after his death, which occurred on March 14, after only five days' illness, following a serious operation. Mr. Wallis was in the prime of life, and one would naturally have expected that very many more years of useful activity would have been spared him. He was a native of Warwickshire, and commenced gardening at Elcot Park, Kintbury, Hungerford. From this place he went to the nursery of Mr. E. van der Meer, Croydon, and thence to Sulhampton House, Berks., and on to Mongewell Park, Wallingford. His next move was to Bucklebury Place, the Berkshire garden of Mr. Arthur Sutton. From there he became foreman at Wyford Court, Oxfordshire. Twelve years ago he was appointed head gardener at Sherfield Hall and seven years later he took charge of Drayton House Gardens, Sherfield-on-Loddon, where he soon made his mark as a good all-round gardener as well as a successful exhibitor of fruit and vegetables. Of unassuming demeanour, Mr. Wallis possessed a lovable nature and was a grand man in all his ways.

TRADE NOTES.

The following Order, made with regard to special rates for market gardening workers in Essex, came into operation on the 24th inst. :—

In the application of the Order of the Board fixing minimum and overtime rates for male workmen in Essex, dated the 2nd July, 1918, to any workman of the age of 21 years and over employed wholly or mainly in connection with the use of land for a market garden under a contract of service or apprenticeship with an employer who is engaged in the trade or business of market gardening :—

(1) 36s. shall be substituted for 32s. in Clauses 1 and 2 as the minimum wages payable in respect of 54 hours in summer and of 48 hours in winter.

(2) 36s. shall be substituted for 32s. in Clause 3 as the minimum weekly wage payable in the case of a whole-time workman employed by the week or any longer period for the hours of work agreed between him and the employer in any week (excluding hours of overtime employment), notwithstanding that those hours are less than 54 in summer or 48 in winter.

(3) 10d. shall be substituted for 9d. in Clause 4 (2) (a) as the differential rate for overtime on week-days.

(4) 1s. shall be substituted for 11d. in Clause 4 (2) (b) as the differential rate for overtime on a Sunday.

This Order shall come into operation on the 24th day of March, 1919.

SOME members of the horticultural trade want total prohibition of imports of horticultural produce; others want unrestricted imports; and others desire prohibition in certain directions and free imports in others. Each group has arguments in favour of their own views, and on Thursday, March 20, at Essex Hall, Strand, the opportunity of expressing these views was afforded. The meeting was arranged jointly by the Horticultural Trades' Association and the British Florists' Federation, and it followed a morning meeting of the Chamber of Horticulture at which there was a preliminary discussion concerning the answer to be furnished to the letter from the Horticultural Advisory Committee of the Board of Agriculture asking for a considered expression of opinion with regard to the relaxation of the present prohibitory Orders.

THE Chamber of Horticulture meeting felt that only one answer to the inquiry could not well be given, because, while there seemed to be little or no difference of opinion about the exclusion of the majority of ornamental and forest trees and shrubs, there might be great diversity of opinion as to the exclusion of bulbs, owing to the fact that there are growers, and also dealers who are not growers. This view was placed before the afternoon meeting, and about three-quarters of the time was taken up in discussing the bulb question. Mr. G. W. Leak made a capital chairman. Messrs. R. Wallace, W. Atkinson, W. Cuthbertson, W. Laxton, R. Oldham, G. W. Barr, A. W. White, M. Allwood, L. Perkin, F. Sander, H. Hudson, B. Cant, J. Cunliffe, R. H. Page, and W. H. Page were the chief speakers, in addition to Mr. Chas. E. Pearson (secretary, H.T.A.), and Mr. C. H. Curtis (secretary, B.F.F.), in a meeting attended by nearly 250 people.

Discussion continued from 2.30 to 5 p.m. The first suggestion that all horticultural 5 p.m. The first suggestion that all horticultural imports should be excluded was turned down, and exclusion for five years met with no better reception. The spirit of compromise prevailed, and eventually it was agreed by a very large majority "That the embargo on the importation of the following bulbs from Holland be removed, and that free imports of these kinds be admitted —*i.e.*, Hyacinths, early-flowering single and double Tulips, Crocus, Gladioli, Spanish Iris, Chionodoxa and Scilla sibirica; and that the embargo on other bulbs be continued for a period of one year from April 1, 1919."

THE nurserymen, as apart from bulb growers and dealers, then had their turn, and the following resolution was passed unanimously: "That the restriction on the importation of peat-loving plants, evergreen shrubs, coniferae, flowering shrubs, creepers, herbaceous plants, rock plants, Roses and forest trees be still maintained for two years from April 1, 1919." It was understood that this resolution applied only to Dutch produce. This over, the flower growers came forward, and in spite of some objections from at least one retail florist, they carried the following resolution :—"That the present embargo on the importation of cut flowers from Holland be strictly enforced and that the granting of licences be discontinued forthwith." All these resolutions were to be forwarded to the authorities by the respective associations and also through the Chamber of Horticulture. A well-deserved vote of thanks to the Chairman concluded an interesting and, at times, quite exciting meeting.

MR. R. GREENFIELD, Leamington Spa, who has been supervising Munition Food Production schemes for the Ministry of Munitions during the past two years, will resume his duties, on April 1, as Midland and Northern representative for Messrs. John Peed and Son, West Norwood.

An inquest was held at Marks Tey, Essex, on the 22nd inst., on the body of Henry Wright, manager to Messrs. Dobbie and Co., seed growers, Edinburgh and Marks Tey, who was found dead in his office from gunshot wounds. Two double-barrelled guns were found lying on the floor, one cartridge having been discharged from each. It was stated that Mr. Wright had been suffering from influenza, and had worried about business matters. His employers stated that his accounts were in perfect order. The jury returned a verdict of "Suicide during temporary insanity." It will be remembered that Mr. Wright recently succeeded Mr. Andrew Ireland as manager at Messrs. Dobbie and Co.'s Marks Tey Nursery.

NOTES FROM IRELAND.

On the 14th inst. the Interim Forestry Authority, consisting of Lord Lovat, Mr. F. D. Acland (chairman), and Mr. T. B. Ponsonby, D.L., received a deputation from several bodies interested in Irish afforestation at the offices of the Timber Controller, 6, Hume Street, Dublin. Four bodies were represented, the Irish Forestry Society, the Royal Horticultural and Arboricultural Society, the Surveyor's Institution, and the Irish Landowners' Convention. Among those attending were the Marquis of Headfort, president of the two first-named societies, Viscount Powerscourt, K.P., and Lord Cloncurry.

Pyrus crenulata yunnanensis has been very conspicuous the winter through, and is so at present, by reason of its heavy crop of rich red fruit, at the entrance to the Royal Botanic Gardens, Glasnevin. Birds seem to let the fruits severely alone, but that they have not been on short rations is apparent in the many veteran Thorns still laden with heavy crops of fruit, now fast shrivelling.

St. Patrick's Day, the great national holiday of Ireland, the 17th inst., proved clear, cold, and dry in Dublin. All sorts and conditions of folks, including many overseas warriors, sported Trifolium minus, the now recognised "Shamrock of Ireland," although evidence is not wanting to show the original plant thus honoured was Oxalis acetosella.

A First Class Cultural Certificate was awarded by the Royal Horticultural and Arboricultural Society of Ireland, at the Council meeting on the 14th inst., to Mrs. Stanistreet, The Rectory, Newmarket-on-Fergus, for a collection of Violets, comprising a score of distinct varieties from the open. *K., Dublin.*

ANSWERS TO CORRESPONDENTS.

BORDERING OF TRAINED APPLE TREES : *J. A. B.* There is no great difficulty in training young Apple trees to two horizontal stems extending within a foot or so from the ground-level; nor is the task of grafting the branch of one tree on to the branch of its neighbour beyond the skill of an amateur.

COLLECTION OF VEGETABLES : *W. E. P.* The member of your Committee is wrong in stating that in a class for a collection of vegetables the number of kinds is never specified. But you, yourself, are wrong in the contention that the number of varieties is always expressly stated in the schedule. In many cases the schedule calls for a collection to fill a certain amount of staging, say, six feet by four feet, and in that case the exhibitor is at liberty to furnish the space allotted to him with any kind and any number of dishes.

CYMBIDIUM HYBRIDS H. E. The names of the Cymbidiums, of which you give parentage, are: C. Diana (Pauwelsii × eburneo-Lowianum), C. Lowio-grandiflorum (Lowianum × grandiflorum, syn. Hookerianum), C. Pauwelsii (Lowianum concolor × insigne), C. langleyense (Devonianum × Lowianum), C. Woodhamsianum (eburneo-Lowianum × Lowianum). The other two crosses with C. Pauwelsii have no recorded name.

FRENCH GARDENING : *B.* Two suitable works for your purpose are *French Market Gardening*, by J. Weathers, price 4s., post free, and *Intensive Culture of Vegetables on the French System*, by P. Aquatias, 6s. 6d., post free. Both works may be obtained from our publishing department.

HERBACEOUS PAEONIES : *T. of Kent.* The only book on the Paeony with which we are acquainted is the *Book of the Paeony*, by Mrs. Edward Harding. This work may be obtained from our publishing department. Price 25s. 9d.; post free.

STRAWBERRY CULTIVATION : *R. C. W.* On the part of your farm where the subsoil is chalk and within 18 inches of the surface, plant the Strawberries on the flat. Where the subsoil is clay and liable to be wet plant three rows on one 6-foot bed with deep alleys between the beds to ensure drainage during the winter. The method of planting should be in rows on the flat 2 feet 6 inches wide, putting the plants 1 foot 6 inches apart; or where much foliage is produced, as in some soils, allow a further 6 inches space both between the rows and the plants. Directly the fruit is gathered clear off the old plants, bury the refuse, dig the ground deeply, and plant Cabbage in September. Runners should be employed for the making of new plantations. Instead of the varieties which you know will not succeed in your soil plant Leader and more Royal Sovereign. Runners are best put out in August or September. Such early plants get well established and sometimes fruit the following season. To prevent the fruit trees being damaged by the horse-hoe use a whippletree narrower than the hoe. The probable reason why your plants of Royal Sovereign were two years before they fruited was that the runners were weak and planted too late.

WAGES AND HOURS. *G. P.* The rate of wages fixed by the Agricultural Board for England and Wales has nothing to do with any Union but is an Order drawn up by the Government and made compulsory. It mainly applies to agricultural workers: certain sections of Horticulture have been brought under its scope, and you will see on p. 159 a note referring to the conditions of market gardening workers' hours and wages in Essex as fixed by the Wages Board, the address of which is 80, Pall Mall, S.W.1.

BULL'S FOOD

FOR

PLANTS, FRUIT and VEGETABLES

makes just the difference and is distinctive because it also feeds the soil, providing it bountifully with that indispensable organic nutriment so essential to the vigorous production of all Plant life, rendering the poorest rich and abundantly prolific, hence its magic power in the soil, trebling the yield of Fruit and Vegetables.

BULL'S FOOD sold by all Seedsmen and Nurserymen.

BULL'S PLANT FOOD CO., 536, King's Rd., Chelsea.

The Reputation

of our

LAWN MOWERS

has been built up since 1832, when we made the original Lawn Mower, on the sound foundations of

Excellence of Design,
Quality of Material,
Accuracy of Workmanship
and
Fairness of Price.

After a strenuous period of work on Munitions we have now resumed the manufacture of Lawn Mowers, which we intend to maintain in their acknowledged position of

The Best in the World

All the problems of labour and material are not yet solved but we are preparing to largely increase our output to keep pace with the demand which is already being experienced. Although we fear that we shall be unable to fill the requirements of all our customers this season, we feel sure those who will be disappointed will extend us their consideration and bear with us until such time as we are in a position to supply them.

CHOICE ROCK PLANTS

FOR SHADY OR PART SHADE ROCK GARDENS.

Now is the time to plant for this Season's effect our new Hybrid Campanulas:—

NORMAN GROVE. A.M., R.H.S., 1914.
A very free-flowering, robust-growing variety. Bell-shaped flowers of a delicate rich blue. Plant 6 inches high and quite hardy. A fine edging plant. Strong Plants, **9d.** each, **7/6** doz.

METEOR. A.M., R.H.S., 1915.
Charming Bell flower, with saucer-shaped flowers, almost white, b having an opalescent effect caused by the soft blue which shows through from the back of the petals. Quite hardy, growing 10in. high
Strong Plants, **2/6** each.

ABUNDANCE. A.M., R.H.S., 1915.
Very prolific flowering variety, pyramidal habit, with bell-shaped lilac-blue flowers. Grows 9in high, and quite hardy.
Strong Plants, **2/6** each.

CHASTITY. A.M., R.H.S., 1916.
Pure white flowers very freely produced. Grows 8in. high, with erect habit.
Strong Plants, **2/6** each.

KENNETT.
Erect blue flowers, saucer-shaped, growing 8in. high. A good variety. **1/6** each.

SYMMETRY.
White flowers, bell-shaped, very free, growing 8in. high. **1/6** each.

One each of the above 6 Choice Campanulas, packed free, for 10/-, carriage paid, cash with order.

HELIANTHEMUM (SUN ROSES).
A most effective plant for a sunny rookery. A blaze of colour—white, pink, orange, red, yellow, cream, in variety. **5/-** doz.

MARKETS.

COVENT GARDEN, March 25.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Daffodils, single, per doz bun.		— white, per doz. bunches ...	10 0–12 0
— Emperor ...	12 0–18 0	Roses, per dozen blooms—	
— Golden Spur ...	8 0–10 0		
— Victoria ...	12 0–15 0	— Richmond, var.	12 0–15 0
— Princess ...	9 0–10 0	Tulips, per doz. blooms—	
Freesia, white, per doz. bunches	4 0– 6 0	— mauve ...	6 0– 8 0
Heather, white, per doz. bun.	6 0–10 0	— white	6 0– 8 0
		— yellow	5 0– 6 0
Lilac, white, per bunch, 6's ...	4 0– 6 0	Violets, single, per doz. bun. ...	3 0– 6 0

REMARKS.—The supplies of cut flowers are again somewhat shorter, and prices are firmer generally. Roses, notwithstanding the colder weather, are a fairly plentiful supply. The leading sorts offered are: Hoosier Beauty, Lady Pirrie, Richmond, Sunburst, Ophelia, Prince de Bulgarie, and W. Stevens, the last a very useful white for market. Best blooms of home-grown Daffodils are soon cleared. Empress, Emperor, Victoria, and Sir Watkin are the leading sorts offered at the present time; Golden Spur is practically finished. Carnation blooms are improving in quality, and there has been a good supply of these flowers up to this morning. French flowers are gradually becoming fewer in numbers; double white Stock and Star (Allium), which is arriving in good condition, are replacing the White Narcissus, which is now finished. The supplies from Guernsey and Scilly are greatly reduced, and these are cheap Daffodils. White Narcissus is selling at higher prices than last week.

Vegetables: Average Wholesale Prices.

— Almonds, per cwt.	110 0–112 0	—Winter Nelis, per case	75 0–80 0
— Barcelona, per cwt. ...	110 0 —	Strawberries, per lb.	25 0–35 0
— Brazils (new). per cwt. ...	85 0–90 0	Pineapples. each	4 0– 7 0

REMARKS.—Supplies of home-grown Grapes are gradually diminishing in quantity. Gros Colmar and Muscat Grapes from Belgium are arriving in fairly good condition, considering all the circumstances. A few forced Strawberries are obtainable daily. Pineapples are fairly plentiful. Pears on offer consist of the varieties Easter Beurré and Winter Nelis. Supplies of forced vegetables are very limited. A few Vegetable Marrows are on offer. Chicory from Belgium shows a considerable increase in quantity. Outdoor vegetables continue to be scarce. Large numbers of Onions are reaching the market from Dutch growers.

GARDENING APPOINTMENTS.

Fig. 1.

Once Tried, Always Used.

The "PATTISSON" HORSE BOOTS

SIMPLEST! STRONGEST! MOST ECONOMICAL!

SOLES of best **English Sole Leather (Waterproofed)**, with Motor Tyre Rubber, Studs, or of Solid Rubber. Fig. 1 can be **Refitted repeatedly**, equal to New Boots. **Rubber Soles Strongly Recommended.**

USED FOR MANY YEARS IN THE ROYAL AND IN THOUSANDS OF THE PRINCIPAL GARDENS.

The "PATTISSON" BOOTS are the most durable on the market, outlasting several sets of ordinary boots, and when worn out can be many times refitted and are then *equal to new ones*, but this can only be satisfactorily done by us the makers.

SILVER MEDALS. Royal Horticultural Soc., 1904 & 1914. Royal International Exhibition, 1912.

Hundreds of Testimonials. The "Field" says:—**"As good as anything that could be devised."**

PLANTS! PLANTS!! PLANTS!!!

Tomato Plants, good hardy short-jointed stuff, ready for fruiting quarters, Kondine Red, Bides's Recruit, Ailsa Craig, Peacock's Beatall, 4/0 per dozen, 30/- per 100. Holmes' Invincible, 5/- per dozen, 35/- per 100. All out of sixties. Cucumber Plants, ready for planting out, Rockford's Telegraph and Chennell's Challenger, 7/6 per dozen, 50s. per 100. Well-rooted cuttings, Double Marguerites, Mrs. Sanders, 12/-. Good Mixed Fuchsia, 12/-, Heliotrope, Lord Roberts, 12/0, all per 100. Cold house, well-rooted Chrysanthemum cuttings, Western King, 15/-, Baldock's Crimson, 15/-, H. W. Thorp, 12/-, Source d'Or, 12/-, Lizzie Adcock, 12/-, Early Framfield White, 12/-, White Quintus, 12/-, Kathleen Thompson, 12/-; Singles, Pink Pagram, 14/-, Bronze Pagram, 14/-, Commodore, 14/-, E. J. Ellis, 14/-, and Glorious, 14/-; all per 100. Carriage and packing free. Cash with order. Please mention paper.

H. S. HOLMESTED, Bretby Nurseries, Burton-on-Trent.

ASPARAGUS.

This esteemed Vegetable may now be safely planted. We can offer fine clean and fibrous rooted crowns grown on sandy Loam.

The following varieties are the finest at present in cultivation:—

HARWOOD'S PEDIGREE GIANT. CONNOVER'S COLOSSAL.
AMERICAN GIANT PALMETTO. COVENT GARDEN.

Two Year Plants ... 10/- per 100.
Three Year Plants ... 20/- per 100.

Seed can also be supplied, 6d. per packet, but two or three years are saved by purchasing plants.

CULINARY PEAS.

CULINARY Peas are amongst the most appreciated of vegetables at whatever season they are available, but good Peas are not the easiest crop to produce. During the summer and autumn, excessive heat, wet, and changeable weather affect them adversely, whilst mildew frequently appears with great suddenness, sometimes affecting the whole crop in a few days, even when precautionary measures are taken. The Pea crop repays good cultivation, and to obtain the best results abundant supplies of food in an easily assimilated form are necessary. The Pea resents, to an extraordinary degree, soil highly charged with farmyard or stable manure, and no plant dislikes rank manure, in any form, more than this vegetable.

The common plan of digging narrow trenches and filling them with manure, afterwards covering the dung with only a few inches of soil, in which the seeds are sown, cannot be commended, except for assisting the plants to withstand drought, and even for that purpose is of doubtful value. Manure retains moisture for a considerable period, yet the roots of Peas will not penetrate it until it is sufficiently decomposed to enable them to assimilate the food it contains. Experiment has proved that the roots will penetrate the soil to a great depth, whilst entirely avoiding the rank manure in the trenches.

The root system is extensive, and in well-prepared soil lateral roots are emitted, which penetrate to a great distance. It frequently happens that the sinking of the soil caused by the decomposition of the manure breaks the roots which enter the trench wall.

Moreover, in the case of heavy soils, during a continuance of rainy weather, the trench acts as a drain for the surrounding soil, and the excess of moisture causes disease and premature decay of the plants.

In many kitchen gardens, especially those that have been heavily manured for many years in succession, the soil contains much humus, often in an acid condition, which is fatal to the growth of Peas. Such soil, if well trenched without adding manure, but with the addition of a good dressing of lime, proves an ideal medium for the Pea crop. Poorer soils are improved by deep trenching and incorporating plenty of leaf soil, if this material is available, or a moderate amount of farmyard or stable dung distributed evenly and not deposited in the trenches in solid layers or masses. The soil should be prepared in autumn or early winter, and a light dressing of basic slag and Kainit, in the proportion of four parts of the former to one of the latter, is beneficial. A generous dressing of wood-ash, which should be well forked below the surface before the seeds are sown, is also beneficial.

For several years my best results with Peas were obtained on soil that had been well trenched and enriched with manure the previous year, and subsequently trenched, nothing but lime being added the second time. In both wet and dry seasons Peas grown in ground that had been treated in this manner were more productive and healthy than those grown in trenches by way of experiment, or those grown in land that had been recently manured.

Crowding the plants is frequently the cause of failure. Many of the most productive mid-season varieties are of spreading habit, and if sown thickly give a poorer return than inferior varieties sown thinly. Such sorts should be sown at least six inches apart, and preferably one foot. With ample space, each plant will develop into a perfect specimen and produce many lateral growths that will branch and re-branch, producing large pods in great quantity over a lengthened period.

I once saw a field of Peas of a well known mid-season variety grown for seed. The seed germinated badly and in many cases the plants were a yard apart. The farmer expected failure, but instead, each plant, having room for development, branched out in all directions, and eventually a record crop of seeds was produced.

Uniformity of moisture at the roots is desirable, but not always obtainable. Much maybe done by a weekly or bi-weekly stirring of the surface soil with a hoe or other suitable implement from early in spring onwards. Hoeing creates a dry mulch which, on well trenched land, prevents soil moisture from evaporating. Mulching with manure or litter is not generally desirable, as it tends to cool the soil excessively, but a mulch of light litter may be used on heavy clay soils, which are difficult to hoe after a spell of wet drought suddenly appear white with some light material, crack badly and lose much of their natural moisture through evaporation.

The advent of mildew may frequently be traced to the plants receiving a sudden check, such as is caused by a cold night following a warm day, or cold rains after a spell of drought. Plants which are apparently quite healthy during times of drought suddenly appear white with mildew after a soaking of water. The moral is obvious, withhold water, trusting instead to deep and thorough cultivation and to constant surface stirring to retain the soil moisture and maintain uniformity of temperature in the soil.

In selecting varieties, give preference to those that are known to suit the particular locality. Certain Peas will not succeed in some districts, although other varieties that may be very similar in habit succeed perfectly.

Seedling Peas may be transplanted with advantage for early and second early supplies. The seeds should be sown in boxes containing fine soil, and the seedlings grown in cool, light conditions. They may be transplanted when large enough for transference and the soil and weather conditions are suitable. Raising the plants in pots, squares of turf and long shallow troughs is generally unnecessary, the plants succeeding much better if the roots are shaken free from soil and extended to their full length. Transplanted Peas succeed better than those sown direct; why, it is difficult to say. Shaking the roots free from the soil is advisable, except where the land is a sticky clay in which the roots are difficult to establish. In such soils it is necessary to place fine soil round the roots when transplanting—a use of time which few gardeners can afford in these times of labour shortage. In such cases, rearing the plants in pots is advisable. Staking is an important detail, the stakes should be placed in position before the shoots have fallen on one side; small, twiggy branches should be used first, and larger stakes, suitable for the variety, at a later stage of growth. The stakes should lean outward from the rows and not meet at the top in an acute angle.

Retarding the crop may be accomplished by removing the blooms as many times as necessary. Removing the flowers also results in stronger haulm preparatory to cropping. *E. R. Janes.*

DRYAS.

All the members of the genus Dryas are prostrate shrubs with branches that grow closely pressed against the stones and soil of rocky banks. There are only three species, and these are spread over the whole of the North Temperate and Arctic regions, including the mountains of Yorkshire, Scotland and Wales. Here they form wide cushions of shining green foliage furnished during the summer with numerous flowers consisting usually of eight petals. They are all of easy cultivation except D. integrifolia: they should be planted in full sunshine on a rocky bank in soil consisting largely of decayed leaf soil with sand and loam. The plants may be increased freely by means of division or by layers, and may also be propagated from seeds.

D. octopetala (see Fig. 67).—This species is the most ornamental and the best for gardens. The plant forms mats of foliage consisting of shining, dark green toothed leaves that are silvery white beneath. During the summer the plants are studded with handsome, pure white flowers, in shape like a wild Rose, having in the centre a bunch of yellow stamens. The blooms are about 1½ inch in diameter and are produced singly on stems two or more inches in length. The flowers are succeeded by pretty feathery ornamental tufts like those of Pulsatilla. The species is a native of this country and is also found on most of the mountains of the northern hemisphere, preferring limestone, but it occasionally grows wild on granite up to a height of 9,000 feet. The variety lunata has sometimes been accorded specific rank. It is a Tyrolese form with a silvery pubescence on the upper sides of the leaves which in D. octopetala are always smooth and glabrous. In another form,

known as minor, the leaves are very small—only half an inch long, and the flowers also are smaller. As the species is found growing in such a variety of conditions it naturally varies to a great extent, and it is not surprising that names have been given to other forms such as D. vestita and D. Sundermannii.

D. DRUMMONDII.—This species is found on the mountains of Eastern Siberia and Northern and Arctic America. It is less attractive than our native species, forming low tufts of slightly pubescent leaves that are not so deeply toothed as in D. octopetala. The yellow flowers are nodding and borne on stems about four inches long, which elongate when the silky fruit heads are developed. The plant is a rampant grower when established, and soon covers a considerable area.

D. INTEGRIFOLIA.—This third species is a native of Greenland and the mountains of Arctic North America. Closely tufted in habit, with shining green leaves that are practically entire, it is the smallest member of the genus. The flowers are white, also eight petalled, and borne on stems about 2 inches long. It is the rarest of the three species in cultivation and not so easy to cultivate as the others, although it will flourish in rich, stony soil in open situations where there is plenty of moisture. *W. I.*

FIG. 67.—DRYAS OCTOPETALA: FLOWERS WHITE.

THE ALPINE GARDEN.

AUBRIETIAS.

THE manifest progress which the Aubrietias have made during recent years is amply demonstrated by their increasing popularity.

Few flowers occupy such a dominant position in the spring garden as these, and certainly few lend themselves so effectively to the production of such wonderful colour effects as the Aubrietia.

To go back about twenty-five years, and note once again the typical Aubrietias, A. deltoidea and A. graeca, with their scant varieties (including the pink-flowered Leichtlinii), enables the progress that has marked the intervening years to be realised.

The possession of the fine varieties of the present day gives the garden-maker splendid material for decorative gardening. For the varied phases of spring bedding, for margining the sides of pathways, for carpeting Rose beds, and, above all, for making glorious drifts and masses of colour in the rock garden, the Aubrietia has no equal.

In making this statement I am considering "effect" pure and simple. The Rock Violas, especially the newer forms, and the finest Saxifrages are exceptionally noteworthy, but nothing else can provide those wonderful colour pictures, in which pink, red, blue, purple, violet, and lavender combine with their intermediate shades to make such a splendid riot of beauty upon the slopes and drifts of the rock-garden.

In tracing the varietal progress, one calls to mind that favourite red Fire King; Campbellii blue; Hendersonii, purple; and the ever useful rose-coloured Souvenir de W. Ingram.

Of Fire King, one can speak of its continuous run of popularity. For many years it held a sway all its own as "the red Aubrietia." The first to challenge its supremacy was Bonfire, more brilliant in colour and a little improvement in size and habit. Triumph, a deeper red of different tone, came later, and was an improvement in size and colour, but undoubtedly the finest red of the day is Vanguard, a highly meritorious variety with a very brilliant colour, and no one who loves Aubrietias can afford to miss Vanguard.

Dr. Mules, the popular blue-violet variety, is still a favourite standard variety, holding its own better than Pritchard's A1, Royal Purple and others of its period.

To name the best dark purple or violet Aubrietia would be a somewhat difficult task, but to my mind Rival will prove the finest violet, unless (as may well be) there is a better variety in the making, but for the present Rival is good enough, and certainly none can excel it in its floriferous display and neat habit.

The best variety of the ruby-purple tone, a very effective colouring, is undoubtedly Invicta. A mass of Invicta is an almost unforgettable picture when in its full beauty.

In the soft shades Lavender and Cinderella are both extremely beautiful, and quite distinct in every way.

An unusual colour is found in Lady Marjorie, a combination of red and mauve which is almost indescribable. This variety again is also neat and effective.

Pale pinkish shades such as Bridesmaid, Moerheimii, and Lilac Queen are not brilliant enough to be used alone, but in conjunction with reds, blues, and purples they may be used freely.

Violet Queen is a very useful deep-hued variety of recent date, while other useful new forms are Unity, blue, very neat; Felix, violet blue; and Perfection, a soft shade of red.

In selecting Aubrietias it is best to secure rich well-defined colours if they are to be planted separately. Vivid contrasts catch the eye at once, and should be carefully thought out. Intermixed they are charming, for Aubrietias do not clash even when many shades are used.

Planting should be done in autumn for preference, although they can be planted from pots at any time. An open sunny position is best. They have no prejudice against a heavy clay soil, and in a dry spring this condition assists the prolongation of flowering.—*P. S. Hayward.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM NAEVIUM.

THE elegant little specimen of this charming and rare Orchid in the group staged by Messrs. Sanders, St. Albans, at the Royal Horticultural Society, March 25, served to remind us of one of the many beautiful little Orchids which are steadily vanishing from our gardens before the wave of home-raised seedlings and the impossibility of replacing them by importation for some years at least. It was first discovered in the province of Pamplona in 1842, and later at Truxillo in Venezuela, but only small consignments ever reached this country, and of these, the plants being of small size, many failed to become established. Its slender spikes of closely-arranged, pretty, white flowers spotted with reddish-purple always command the attention of those who admire distinct and attractively arranged flowers.

Odontoglossum cirrhosum is another and larger species of the same class now becoming rare. A good show of it has brightened the Odontoglossum house at the Warren House, Stanmore (orchid grower Mr. W. H. Young), for the last two months, and the plants are still in good condition.

FOREIGN CORRESPONDENCE.

ELECTRIC POWER IN HORTICULTURE.

A CORRESPONDENT in Holland sends us the following note on a device used at Elst in heating the glasshouses in a large nursery establishment:—

After much experimenting the firm M. G. G. Goudriaan, Delft, Holland, has succeeded in constructing an installation which will be a very great advantage in the heating of glasshouses. It is an electro blowing apparatus, which, connected to the fireplaces, enables the fires, in spite of lack of coal and coke, to take full effect, and by means of coal dust, light ashes, brown coal and cinders, produce a temperature such as is ordinarily obtained by normal fuel. This installation, by which, with the aid of only a light electro-motor, the supply of air under the fire is regulated and divided in an ingenious and judicious way, is as yet only used in the hothouses of the "Geldersche Kweekerij" (nursery garden in Guelders), Elst, Holland, manager Mr. H. Weesjes, and has surpassed all expectations.

The invention is, in a large measure, practical and efficient, and can easily be applied to any heating apparatus used in our country. Moreover, the costs of installation are so trifling as to present no difficulties to any grower. The results obtained as yet warrant the supposition that this invention will prove of the greatest importance for horticulture, and the fuel question is therewith solved in the simplest manner possible.

ACACIA.

ACACIA retinodes (see Fig. 68) is one of a number of Acacias which are cultivated as decorative trees in the South of France, and of which the flower branches are used decoratively. The best known of these is A. dealbata, or, as it is now called, A. decurrens, whose elegant fern-like foliage and long racemes of bright yellow ball-like fragrant flowers have for many years been conspicuous in our flower shops in early spring. Next in importance comes A. Baileyana, which has smaller foliage not unlike that of the Sensitive plant, and flowers like those of A. dealbata. It is a better plant for cultivation in this country than either of those here mentioned, as it forms a shapely specimen and is very floriferous; moreover it is hardy in sheltered gardens in this country. This spring this Acacia has been more abundant in the flower shops than any of those sent from South Europe, except A. dealbata, and the dealers say it finds a ready sale for room decoration. A. retinodes is in cultivation under the names of A. fragrans, A. neriifolia and A. longifolia. It is a native of South Australia and Victoria and is now an established favourite in Riviera gardens, whence it is sent to this country for decorative purposes. The long, leafy branches are adorned with short racemes of yellow, ball-like, fragrant flowers. According to Sir E. Loder, this Acacia is hardy at Leonardslee, Sussex, but it is best known as a free-growing greenhouse shrub, large examples of it having been for years conspicuous objects in the Temperate House, Kew, in early spring. The leaves vary in length up to 6 inches. True A. longifolia is easily distinguished by its leaves being broader, more uniform in size, and having a pair of prominent ribs instead of a single midrib. The flowers are on tail-like spikes about 2 inches long, not ball-like as the others are. This also is sometimes among the spring flowers sent to this country in spring from the South of France.

The genus Acacia is one of the largest known and comprises some four hundred species, but only a few are in cultivation. They are found principally in Australia, many having their habitat in New South Wales. The Acacias are very floriferous and amongst the easiest cultivated of all greenhouse plants. In some species the flowers are very fragrant, and a large specimen of A. dealbata in bloom is a pleasing feature in a large conservatory or greenhouse. A. extensa is not common in cultivation, but it is worthy of the attention of growers. The foliage closely resembles that of a Rush. The habit of growth is rather straggling, the plants being inclined to go erect rather than branching, even after being severely cut back. The flowers are among the finest for colour and are a bright, clear, golden yellow. The foliage is very thin and narrow, being about one-eighth of an inch across and six inches long. The branches, when young, have a triangular, winged form, which they lose with age, the older branches retaining small winged pieces arranged at irregular intervals. The species is easily cultivated, very free flowering and grows equally well in pots or planted out.

Acacia urophylla is of an entirely different growth, having wide leaves, a drooping habit, and flowering freely all along the pendulous branches of the young growth. Flowers last on the plant a month or so, and are of a pale lemon yellow colour. The adult leaves are about one and a half inch across and four inches long. The young leaves whilst the plant is in flower, are smaller and more graceful, and of a light green colour, which contrasts very well with the flowers. The branches are slightly spiny. The growth requires to be cut back hard after flowering, and the wood ripens better if the plants are placed outdoors during summer. Plants in five-inch pots are very useful, and lend themselves very readily to decorative purposes. In large pots they make very useful plants for the greenhouse.

Another graceful and beautiful plant is Acacia pulchella. A large plant when in flower presents the appearance of small golden balls in a cloud or mist when viewed from a distance, as the foliage is so fine and thin that only the flowers are seen. The pendulous habit is an added attraction, but the branches are quite strong, and do not hang down unduly when covered with bloom. Either in pots or planted out it is well worth growing and one of the best of the Acacias. It should be cut back after flowering, when it quickly makes an abundance of fresh growth. Plants seem to flower equally freely whether stood out of doors during summer or not. A plant recently in flower in the Temperate House at Kew is ten feet high and was a mass of flower.

A. pubescens is a plant not so easily grown, and is often worked on some of the more freely growing stocks. It is a pretty, graceful plant, the small flowers, in racemes, hanging from the ends of the pendulous branches of feathery leaves.

FIG. 68.—ACACIA RETINODES.

THE BULB GARDEN.

SCILLAS, CHIONODOXAS AND CHIONOSCILLAS.

WHAT is the difference between a Scilla and a Chionodoxa? Most gardeners know these beautiful blue spring flowers by sight, but many would be puzzled to say which was which, or to decide to which of the two genera an unknown species belonged. An examination of the individual flowers shows, however, where the difference lies. In the Scilla the six segments of the flower are divided right down to the base, whereas in the Chionodoxa the six segments are united together for about one-third of their length, and form a kind of funnel in which the ovary is situated. In the Scilla the ovary is clearly to be seen surmounted by its long, slender style and surrounded by six erect and spreading stamens. The anther is lightly attached by its centre to the fine tip of the slender filament. In the Chionodoxa the broad, stiff stamens form a kind of conical roof to the funnel-shaped tube at the base of the flower, and the ovary is entirely hidden from sight at the bottom of this funnel and under this roof. The anthers, too, are curiously arranged, for they are attached by their upper end on the inner side of the filaments, so that they are all crowded close together, and face inwards in such a way as to hang immediately over the stigmatic surface at the tip of the style.

The Scilla which at first sight is most likely to be confused with the Chionodoxas is bifolia, which is not, apparently, altogether aptly named, for when well grown it often produces three leaves. The foliage is very similar to that of the Chionodoxas, but the flowers are arranged all round the stem, whereas those of a Chionodoxa all stand out on one side of the stem. Chionodoxa sardensis with bright-blue flowers, in the centre of which the white cone of the stamens stands out conspicuously, is usually the first to flower, and is almost as early as Scilla bifolia. Next comes the larger Chionodoxa Luciliae, in which the purple-blue of the tips of the petals fades to white at the centre, and this is followed closely by the vivid-blue of Scilla sibirica.

Hybrids between two genera are much less common than those between the species of either

genus, and it is seldom that bigeneric hybrids occur spontaneously in our gardens. On a recent visit to the Kew rock-garden, however, I noticed more than one example of what must have been a chance hybrid between a Scilla and a Chionodoxa. Mr. Irving told me he remembered that such a hybrid had been described by Nicholson under the name of Chionoscilla Alleni (see *Gard. Chron.*, 1897, p. 119).

The hybrid resembles a Chionodoxa in the arrangement of the flowers on the stem, and in the complete covering-in of the ovary beneath the cone of broad stamens. On the other hand, the anthers are attached at their centres, as in the Scilla, and therefore are more obvious than in the Chionodoxa. The shape of the individual flower is a compromise between the two parents, for the segments are divided almost—but not quite—to their base, so that a small funnel-shaped cup forms the base of the flower. Hybrids between widely-separated species are usually sterile; but this hybrid between two genera has every appearance of being fertile, for the pollen is abundant, and the arrangement of anthers and stigma is as well adapted for self-fertilisation as in Chionodoxa. In colour, the hybrids that I have seen closely resemble Chionodoxa sardensis; indeed, they can only be distinguished from that plant by the greater prominence of the anthers, and by the fact that the segments form hardly any tube at the base of the flowers.

The accompanying sketch (Fig. 69) represents Chionodoxa Luciliae above, and below, on the left, Scilla bifolia, with the hybrid Chionoscilla on the right. *W. R. Dykes, Charterhouse, Godalming.*

Fig. 69.—Chionoscilla and its parents.
Scilla bifolia. Chionodoxa Luciliae. Chionoscilla.

LILIUM SUPERBUM.

In its native habitats Lilium superbum is generally found in swamps and moist hollows, so that we should naturally expect it to call for a good supply of moisture in gardens. It is, however, often forgotten that the conditions in which plants grow wild differ greatly from those they experience in gardens. It is, therefore, not surprising that L. superbum does quite well in the mixed border without any special supply of moisture. Much, however, in this connection depends upon the climatic conditions of each locality, and there are places in the United Kingdom, where the rainfall in summer is small, in which Lilium superbum should have more water than in wetter districts. In the former it may be desirable to plant L. superbum by the side of a pond or stream, or in an artificial bog or bed supplied with underground moisture. In the latter this is unnecessary. L. superbum is now so well known that little description is necessary. Mr. A. Grove speaks of its resemblance to L. pardalinum, to which it has a considerable likeness. Its later flowering marks it as distinct, apart from the difference in the bulbs, and the more pointed segments constitute a distinction apparent to the more than casual observer. The colour of the flower varies from yellow to orange-red, the height is from 4 to 8 feet, and the spike produces a large number of flowers—from 20 to 30, or even more, in well-grown plants.

From four to five inches is generally recognised as a suitable depth at which to plant, but in light soil this may be exceeded with advantage, and I prefer six inches in such soil. Even that depth may be exceeded with no disadvantage to the Lily. *A.*

The Week's Work.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford Wrotham Park, Barnet, Hertfordshire.

Roses.—The pruning of Roses may now be undertaken. Very early pruning is not good practice, as it encourages early basal growth that may be damaged by late frosts. Prune the H.P.'s rather closely, and keep the heads open, as overcrowding is detrimental to the production of large, shapely flowers. In some cases, the strong, healthy growths of dwarf plants may be pegged down to fill up space, and then will yield a good supply of flowers, as well as giving the beds a neat appearance. Prune weak side-shoots back to one or two eyes, and allow stronger growths from three to six eyes, according to the height of the plants. Tea Roses should have the inner shoots cut back to two buds, have weak sprays removed, and the strong, flowering wood shortened, but not so severely as in the case of H.P.s. As soon as the plants have been pruned and all suckers removed, give the beds a good dressing of loam and decayed manure, and see that the labels are in order.

Standard Roses.—The heads of all standard Roses should be well thinned, and the shoots pruned, always cutting to an outside bud, using a keen-edged knife for the work. Make the stakes and fastenings secure.

Water Lilies.—From now and onwards Water Lilies may be planted. There are many good varieties of Nymphaeas deserving of special attention, and which, when planted, quickly spread and become effective. If the water is two or three feet deep, with a little mud at the bottom, no difficulty will be experienced in planting. Set the plants in shallow baskets filled with loam and leaf soil, cover the surface with a little moss and flat stones, and gradually sink them. The very choice kinds may be grown in suitable tubs and sunk in the water just where they are required to flower.

Violets.—As soon as Violets have finished flowering, the plants should be divided and replanted on good ground that has been enriched with suitable manure, deeply dug and made moderately firm. Plant single crowns with roots attached, and set them ten inches apart. If the weather should be dry before they are well established, supply the plants with water and apply a mulch of decayed manure or leaf mould.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Globe Artichokes.—The strong suckers that were taken up during the autumn, potted, and wintered in frames, should now be planted out. Plant them in well-manured ground. These Artichokes flourish if given liberal manurial waterings during the summer. Set the plants 3 feet apart, and allow a distance of 4 feet between the rows. If old plants have withstood the trying winter they should be uncovered entirely now, and have the ground forked up around them, adding burnt garden refuse when performing this operation.

Main Crop Carrots.—Too much care cannot possibly be taken in the preparation of the ground for Carrots. The plot should have been deeply tilled previously. Apply a large dressing of wood-ash and burnt garden refuse, then harrow it well in; remove large stones, level the plot, and draw drills an inch in depth and 1 foot apart. Sow the seeds thinly, cover them lightly, and then rake the ground parallel with the drills. In shallow soils rely on Standard, Favourite, and Early Gem varieties, and use the Intermediate types in deeper soils.

Cucumbers.—With the advent of sunshine and longer days, Cucumbers are growing and fruiting freely. Do not over-crop, and cut the fruits when they are large enough for use to prevent undue strain on the plants. Give top-dressings regularly, using two parts loam and one part old mushroom-bed manure, or dry horse-manure that has been passed through an inch-mesh sieve. Stop the growths at every second leaf, but remove weak growths entirely. Always use tepid water for watering and syringing, and maintain at all times a humid, warm atmosphere. An application of artificial manure every ten days will be advantageous.

Broad Beans.—Plants of Broad Beans raised in boxes will now be ready for planting out. Set them in lines 3 feet apart, and if cold weather prevails afford protection by placing evergreen boughs on the north side of the lines.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Canker in Apples and Pears.—Canker is a very serious trouble among Apples and Pears, and some varieties are more subject to it than others; indeed, in some districts it renders certain varieties useless. It is not easy at all times to know what is the real cause of the disease. Some conditions favour it more than others, and it is very often to be seen in neglected and over-crowded orchards on heavy soils, which hold the water, and also in low-lying land. As soon as the disease is detected steps should be taken to discover the cause and find means for checking it. It often starts with the cracking of the bark. Trees growing in very rich soil often make late growths which, not being properly ripened, are susceptible to damage by hail storms and hard frosts and predisposed to canker. In such cases the trees should be lifted and planted in early autumn and all wounds, from whatever cause, should be dressed, cleaned and paitned over lightly with shellac. The best preventive of all is to keep the trees clean, especially the stems and bark, and have the soil drained.

Newly-Planted Strawberries.—Plantations of Strawberries made last autumn should be examined, and the plants made firm in the soil, as they often become loose through the action of frost. Plantations of older plants which have not already been dealt with should be lightly forked over between the rows, taking care not to break the surface roots. Give a top-dressing of manure containing a large proportion of straw, as this provides protection against drought, and is subsequently useful in keeping the fruits clean. Sloppy manures should not be used, as they exclude air and warmth. When suitable manure is not available a dressing of bone meal and kainit in equal prooprtions, applied at the rate of 2 lb. per rod on light soils, and 1 lb. per rod on heavy soils, is desirable.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to C. H. Berners, Esq., Wolverstone Park Gardens, Ipswich.

Melons.—When grown on the cordon system, the points of the Melon plants should be pinched out when they reach the limit of the trellis. This will induce the development of fruiting shoots. Laterals which show fruit should be stopped at the first or second leaf beyond the fruit, according to the space available for leaf development. Laterals which do not fruit should be pinched back to two or three leaves. All lateral growths below the trellis should be rubbed off as soon as they appear, but care should be taken to preserve healthy leaves from the base upwards. Daily attention must be given to the pollination of the flowers. During the flowering period the atmosphere of the house should be kept fairly dry, admitting air freely on all favourable occasions. Allow only three to four fruits to swell on each plant, removing all others as soon as it can be seen which are swelling freely. After the setting period is safely over, growth should be encouraged by regular top-dressings of soil as soon as the roots show through each application of compost. So long as it is possible to apply top-dressings the plants will require no liquid manure until the fruits have grown to half their size. The plants should not lack water at the roots until ripening of the fruits commences. Maintain a temperature of 65° to 70° by night, and 10° higher by day. Close the house early in the afternoons of sunny days, at the same time syringing the plants and thoroughly damping the paths and walls to create a moist atmosphere. Very little air should be admitted when cold winds prevail and the weather is changeable. Sow seeds in small pots filled with loam passed through a fine mesh sieve, and place the pots in a propagating box or plunge them in a mild hot-bed. Provided the soil is moist, no water will be needed until the young seedlings appear.

Second Early Vinery.—Where the Vines have been tied down to ensure an even "break," they should be returned to their proper positions. When this is accomplished, commence to disbud directly the best growths can be determined; no advantage is gained by allowing the shoots to remain crowded before proceeding with this operation. Maintain a night temperature of about 60°, with a temperature of 70° in the daytime, allowing a rise of 10° with sun-heat. Supply water to the roots, if necessary, and create a humid atmosphere by damping the paths and walls several times a day. Spray the rods lightly, close the house early in the afternoon to conserve the sun-heat as much as possible, and ventilate freely during the early part of the lay when the weather is favourable.

THE ORCHID HOUSES.

By H. G. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Deciduous Calanthes.—The vestita and Veitchii groups of the genus Calanthe are most useful flowering stove plants, and generally, where numerous varieties are grown, a succession of flowers may be had throughout the winter. The necessary cultural conditions are few. A moist, warm atmosphere during the time the plants are making their growth is necessary. A temperature which ranges from 65° to 70° by night, with a rise of 15° by day, accompanied with shade during the hottest part of the day, and a position near to the roof glass, are the salient points in their culture. When growing in a moist atmosphere the foliage is susceptible to scalding if exposed to strong sunshine; therefore, the latter should be permitted to reach the plants only when the new bulbs begin to form, and then only in a very gradual manner, so that full exposure may be allowed by the time the pseudo-bulbs have fully developed. As the plants become gradually inured to sunshine, more air should be afforded correspondingly.

Repotting.—Deciduous Calanthes should be repotted soon after growth commences and before new roots begin to push out from the base. Turn the plants out of the pots, and carefully shake all the old soil from the roots; cut the dead roots to about 1 inch in length, as their stumps will help to keep the pseudo-bulbs firm in the new soil until the new roots become firmly established. Strong pseudo-bulbs should be potted separately in 5-inch and 6-inch pots, this being the best plan when the plants are to be utilised for decorative purposes. The smaller bulbs may be placed several together in 7-inch or 8-inch pots. The pots should be quite clean, and they should be half-filled with clean crocks, with some Sphagnum-moss placed on top, or in place of this some fibrous loam, or a layer of thin turf. If the latter is used, place the grass side downwards. The drainage is a very important point, as Calanthes require much water during active growth. The compost is important, and it is on the preparation of this that success largely depends. The soil should be of a firm, retentive nature, yet of such texture that the roots can enter it readily, or it will become sour in a short time. Good turfy, yellow loam answers the purpose best, using three parts of this to one part consisting of partly-decayed Oak leaves and chopped Sphagnum-moss, with a free addition of sharp silver sand and crushed charcoal, the whole being well mixed together. Place the pseudo-bulbs just sufficiently deep in the soil to enable them to stand erect and no more, and make the soil moderately firm around them to within a half-inch of the rim of the pot, thus leaving sufficient space for watering, and for subsequent top-dressings of fibrous loam when the plants are in active growth. If the soil is moist, as it should be, give no water for two or three weeks. By that time the new growths will have advanced a little, and then an occasional light sprinkling will be beneficial; syringe between the pots several times a day, according to the state of the weather. Watering, during the early stages of growth, should be done with much discretion; if the soil is made too wet the tips of the young roots decay, the tips of the new leaves turn brown, and the health of the plant is seriously affected. When roots are numerous, have a firm hold of the compost, and cling to the sides of the pots, water may be given more freely, and when thoroughly well established in abundance, with weak liquid cow manure at every alternate watering. In the summer, when the bulbs are swelling freely, and new roots appear on the surface of the soil, apply a top-dressing of fresh, turfy loam; this will be the means of adding luxuriance to the foliage and strength to the future flower-spikes. Previous to repotting, it is advisable to carefully examine each pseudo-bulb for scale, for if the pest is not removed at this period, endless trouble may be caused all through the growing season. These insects may now be eradicated easily by means of a stiff brush and an insecticide, but when cleaning the bulbs care must be taken not to injure the buds.

PLANTS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Plants in Flower.—Cinerarias, Primulas, Marguerites, Genistas, Mignonette and various spring flowering bulbs are now making the flowering house and conservatory gay. They will need very little fire heat except during cold nights, and if given an abundance of air in fine weather the period of flowering will be prolonged. Water the plants frequently with weak liquid manure, and guard against insect pests by lightly fumigating the house occasionally.

Raising Cinerarias and Primulas.—Sow seeds of Cinerarias for providing plants to flower next winter. Sow seeds of Primula malacoides and P. obconica, and also make a small sowing of P. sinensis varieties. Shallow, well-drained pans filled with finely-sifted, light soil, should be used. Soak the soil thoroughly with water before sowing, cover the seeds with a sprinkling of light soil, and place a sheet of glass (covered with brown paper) over each pan until the seeds germinate, when they should be exposed to light and air.

Chrysanthemums.—Rooted cuttings of the latest decorative Chrysanthemums should be potted into 4½- or 5-inch pots, three in a pot. For this potting use a compost of loam, leaf-mould, sand and a little artificial manure. Pot firmly and place the plants near the roof glass. Keep the atmosphere close for a few days, and then remove them to a cold frame. The more forward plants should now be placed in a cold frame and have their shoots pinched when 4 to 5 inches long. Syringe them occasionally with an insecticide to keep them clean. Plants intended to produce large blooms should now be potted into 6-inch pots, and grown near the roof glass in a cool atmosphere. Cuttings of outdoor, autumn-flowering varieties, may now be struck in boxes placed on a shelf in a cool greenhouse. At first shade them from strong sunshine, and when rooted some may be potted, two or three in a 7-inch pot, to flower in the greenhouse before the indoor decorative varieties.

Deutzias.—Deutzias that have finished flowering should not be cast aside; cut back the old growths, repot the plants if necessary and place them in a warm house, syringing them daily and giving liquid manure to those not repotted, in order to develop strong, healthy growth.

APPOINTMENTS FOR APRIL.

TUESDAY, APRIL 8—
Royal Hort. Soc. Coms. Meet.: Special Daffodil Show. Lecture by Rev. J. Jacob at 3 p.m. on "Freesias and Lachenalias."

WEDNESDAY, APRIL 9—
Wargrave Gard. Soc. meet.

MONDAY, APRIL 14—
United Hort. Ben. and Prov. Soc. Com. meet. Bath Gard. Soc. meet.

THURSDAY, APRIL 17—
Manchester and North of England Orchid Society meet.

FRIDAY, APRIL 18—
Good Friday.

MONDAY, APRIL 21—
Bank Holiday.

WEDNESDAY, APRIL 23—
Wargrave Gard. Soc. meet.

TUESDAY, APRIL 29—
Royal Hort. Soc. Coms. meet. and Nat. Auricula and Primula Society (Southern Section) Combined Show. Nat. Rose Society Spring Meeting. Lecture by Dr. F. W. Keeble, F.R.S., at 3 p.m., on "Horticultural Education and Research."

Average Mean Temperature for the ensuing week deduced from observations during the last fifty years at Greenwich, 46.0°.

Actual Temperature:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, April 2, 10 a.m.: Bar. 30.11; temp., 43°. Weather—Fine.

Land Settlement. The Land Settlement and Land Acquisition Bills, which will be under the consideration of Parliament in the immediate future, describe the machinery whereby it is proposed to effect the long-promised settlement of ex-service men on the land. The latter Bill makes provision for the speedier acquisition of land, and enables County Councils, who will be the statutory authority for land settlement, to acquire and enter on the possession of land more speedily than was possible under the Act which it supersedes. It is a manifest fact that the present time presents peculiar difficulties which have to be overcome if land settlement is to be accomplished. Land has increased in price, and building and all kinds of equipment cost double, or more than double, than they did before the war. Hence, since land settlement is a National and not solely a local affair, it is essential that the State should assume responsibility for what may be called the difference in necessary cost of land settlement in pre-war and present times. This is provided for in the Land Settlement Bill, in accordance with the provisions of which the Board of Agriculture will for a period of seven years make good annually the difference between receipts in the way of rent and expenditure by way of interests on loans raised by County Councils for the purchase of holdings. At the end of seven years the small holdings of each County Council will be valued, and the difference between original cost and present value written off; thenceforth the holdings will be administered by the Councils without further financial assistance from the State.

Under the Bill the dimensions of a holding will be more elastic than heretofore, and what may be called full-time and part-time holdings will be provided. In the case of the latter, the holding will consist of a piece of land of half-an-acre up to an acre, attached to a cottage, and will be available for occupation and use by a man employed in a wage-earning trade—the object being to enable labourers and others engaged in rural occupations to add to their means of subsistence, and also to their interest in life, by the spare or part-time cultivation of the land and the rearing of small stock, poultry, &c.

In this connection it is of interest to know that an enquiry recently made by the Board of Agriculture of the men of one army corps in France elicited the information that a very large proportion something like 75 per cent. of the men who contemplated taking small holdings—desire part-time holdings.

For the use of whole-time small-holders, holdings up to 50 acres—the size varying according to the nature of the cultivation to be practised—are to be provided. For holdings of this type applicants must of necessity be possessed both of practical experience and of some capital. To encourage inexperienced men to start without training to cultivate a holding would be to court disaster both for the men and for the scheme. Given adequate experience, the possession of insufficient capital will not bar a man from a holding, although he may have to begin in a small way, for the Bill proposes to empower County Councils to make loans—probably on a pound-for-pound basis—to small holders to enable them to purchase seeds, tools and stock. In the case of the would-be settler who has no practical experience, we understand that the Board of Agriculture proposes to establish short courses of training sufficient to enable the men who undertake them to become wage earners on farms and market gardens. There, as well as in the part-time holdings which they will be able to obtain, they will gain the practical experience which should equip them later on for a whole-time holding.

This end it is proposed also to provide for in another way, namely by the establishment of settlements, of which already four have been founded. A land settlement will be of one of two types. In one case the settlers will work for wages on a central farm and will thereby have an opportunity of gaining experience. As soon as they have obtained the necessary practical knowledge they will be enabled to take up a holding the size of which will naturally be determined by the amount of capital they have at their disposal. Thus, in course of time, a group of settlement holdings will be established around the central farm, and the holder will be able, according to the size of his holding, either to devote all his time to its cultivation or to spend part of his time on his own holding and part working for wages on the central farm. The holders will enjoy the advantage of the advice of the director of the farm, and by association in a settlement should also be in a position to buy and sell co-operatively. In the other type of settlement skilled men will enter at once in the occupation of a holding, which will be one of a large group of—so far as may be—holdings of a fairly uniform type.

So far as machinery and method go it is difficult to see how the scheme of Land Settlement worked out by the Board of Agriculture could be improved upon. It makes provision for men of very different categories and provides the means whereby it should prove possible to satisfy all reasonable expectations. It is evident, of course, that settlement must be a slow process and that both waiting and waiting lists are bound to be long. Good land must be obtained, and yet good farmers must be interfered with as little as possible. Even under the accelerated powers of land acquisition provided by the Bills delay must occur in obtaining land, and probably yet more delay in providing housing and equipment. Yet, if those who want holdings are able to utilise their time of waiting by increasing their experience this inevitable delay will not be without its advantages. Finally, it is to be noted that whereas ex-service men will have priority, others—so far as the land which becomes available will allow—will also become entitled to take small holdings. A number of holdings will also be available for women of the Land Army, and provision will be made whereby holders may purchase their holdings.

In as much as it is our present purpose only to describe the scheme of land settlement, we do not propose now to enter into the consideration of the difficulties which must be overcome if the small holdings, when established, are to prove remunerative to those who cultivate them. That difficulties exist, and must be faced, is within the knowledge of the cultivators; but a discussion of these difficulties may be left to another occasion.

British Gardeners' Association.—The Annual General Conference of the British Gardeners' Association will be held at Birmingham on Monday, May 12.

Changes at Richmond Park.—Mr. S. Pullman, Superintendent for 22½ years of the Royal Park, Richmond, Surrey, has just resigned his appointment. Richmond Park is one of the famous beauty spots of England, and, we may say, the world. The views of the "silver winding Thames" from its higher boundaries have long inspired poets and painters. Sheen Lodge, close by, was a favourite retreat of our monarchs from the time of King Henry VIII., who made full use of the park. It includes over 2,350 acres, and usually contains a herd of 1,000 head of deer. Feathered game is preserved in the enclosures, and here King Edward VII. loved to shoot several times a year. The park is well wooded, and in the "covers" the immense clumps of Rhododendron, even though principally of R. ponticum, and Bluebells, present a memorable spectacle during their flowering season. Mr. Pullman took charge when the Royal Park ceased to be under the Rangers' Department, and thus succeeded the Duke of Cambridge. Mr. Pullman is a native of Evershot, Dorset: he managed an important estate in Scotland before returning south. He is succeeded by Mr. Wells, Superintendent of Bushey Park, who in turn is succeeded by Mr. J. S. McGregor, for many years Assistant Superintendent at Richmond.

Reorganisation of the Board of Agriculture and Department of Horticulture.—On March 26, in the House of Commons, Mr. H. Hope moved and Mr. Leslie Scott seconded a resolution, "That, as a necessary and immediate preliminary to agricultural reconstruction, it is essential to reorganise the Board of Agriculture, and to accord the Department the status, staff and accommodation of a first-grade Ministry." The Government accepted the motion and expressed the hope that it would be carried into effect at the earliest possible moment. The Government policy in connection with this proposal was briefly outlined by Sir A. Griffith-Boscawen, Secretary to the Board of Agriculture. He stated that the Board of Agriculture must no longer be a negative department, merely carrying out certain Acts of Parliament. The proposed Ministry should investigate all matters connected with agriculture and horticulture and promote the welfare of rural life. It was proposed to establish an agricultural authority in

each county and an Agricultural Council for England and for Wales, with statutory authority. By this means an advisory body would be created, fully able to suggest and discuss improvements and new methods of cultivation and thus be able to supply the Government with the best advice available for the needs of any particular part of the country. Matters to which special attention would be given included small holdings, cultivation of lands, drainage, agricultural education, land reclamation, diseases of animals, diseases and pests of plants, and weeds, as well as such matters as the supply of raw materials, lime, marketing, seeds and seed testing. It might be possible to develop Sugar Beet, Hemp and Tobacco cultivation in this country. It was also proposed to develop largely the horticultural work of the Ministry, especially in connection with the extension of small holdings and allotments, market gardening, fruit cultivation and vegetable production, and introduce intensive cultivation on the lines of the "petite culture," practised so successfully in French rural districts.

The Study of Economic Botany.—At the lecture delivered by Mr. Edward White, on the subject of "The Study of Economic Botany and the Professional Openings it Offers," at the meeting of the Royal Horticultural Society on the 25th ult., Lt.-Col. Sir Albert Rollit, D.C.L., Member of the Council of the Society and Chairman of the Horticultural Education Committee of the Senate of the University of London, in the chair, it was proposed by the Chairman, and carried unanimously, that the President and Council of the Society be requested to send the following Memorandum on the Study of Economic Botany to the Editors of the London and Provincial Press :—

"(1) A very large proportion of the essential wealth of the world is derived, directly or indirectly, from the vegetable kingdom—as, for example, food, clothing, building material, medicines, rubber, oils, dyes, resin, etc. (2) It is to the development of such sources of wealth as these that we must in great measure look to repair the devastation and impoverishment caused by the war. (3) When peace arrives there will be an immense demand for that skilled knowledge which alone can efficiently employ the known, and investigate the vast potential but as yet unknown, resources of our Great Empire. (4) We are afraid that it is true that the chief positions all the world over in promoting and directing the growth and utilisation of known economic plants, and investigating the properties and capabilities of hitherto unused ones, have to a very large extent, and out of all due proportion, been filled by men of alien nationality. And if, now the war is over, these positions are not to fall back into the same hands again, but are to be filled by men of our own race and Empire, it can only be by the attention of our younger men being at once directed to the study of that science which is at the base of all knowledge and experience necessary for operations connected with economic botany. (5) Praiseworthy efforts are being made in many quarters to make good the defects in the scientific equipment of our Universities and Public Schools which the strain of war has revealed. And it is not out of place to mention that quite recently, at the instance of our Society, the University of London has instituted a Degree in Horticulture for the express purpose of encouraging this particular study. (6) The Council of the Royal Horticultural Society accordingly wishes to rouse the younger men of this country to appreciate the importance of the Science of Botany in its economic aspect. It is foolish to say: "We will employ no more aliens in cultivating the plants and testing their produce," unless we have skilled men of our own ready to fill the gaps. (7) The Council also wishes to direct the attention of all educational authorities and of parents who are looking for new careers for their sons, to the issues referred to above. And the Council does this the more earnestly because there is not a moment of time to be spared; and they fear that the study of Natural Science does not generally receive such attention in Public Schools and other centres of education as its national importance deserves. (8) It is not necessary at the moment to consider the causes of this neglect of a most useful, engrossing and remunerative subject. The Council's immediate purpose is to indicate the pressing importance of it if British brains are in future to direct the development of the vegetable wealth of the Empire. (9) It is a matter which intimately concerns the great corporations, companies and merchant houses, and those whose staple industries are derived from the raw materials produced from the soil in the many quarters of the Empire. The Council ventures to suggest that it is of the utmost and immediate interest of all such bodies to encourage in a practical manner the study of science, upon the national efficiency in which such predominant issues depend. (10) The Council of the Society will be happy to assist by any means in its power in the consideration of this most important subject. *W. Wilks, Secretary, R.H.S.*"

The President of the Royal Horticultural Society.—All who have experienced the unfailing kindness and courtesy which characterises Lord Grenfell will learn with sincere regret that his many public duties have compelled him to resign the presidency of the Royal Horticultural Society. During the years which he has occupied this office Lord Grenfell has endeared himself to all members of the Council and has devoted himself enthusiastically to promoting the interests of horticulture. We are informed that his successor as President is Lord Lambourne, whose interest in and knowledge of horticulture, are universally known and appreciated. The Society has always been fortunate in its Presidents, and its good fortune is enhanced by Lord Lambourne's acceptance of the office.

[*Photo by A. Hands.*

Fig. 70.—Lord Lambourne, C.V.O., the new President of the Royal Horticultural Society.

A Valuable Plant for the Rock Garden.—A new variety of Epilobium chloraefolium, named by Dr. Cockayne kaikourense, should prove, according to the description* of the author, a valuable acquisition for the rock garden. The variety is distinguished by its exceedingly robust habit and its large white flowers which, when fully opened, are over one inch in diameter, and long lasting. The stems are smooth, shining, and purple in colour, and the somewhat thick coriaceous leaves are bright or yellowish green above and often reddish beneath. In New Zealand the plant continues in bloom for more than six months. The variety is limited in its distribution, being confined to the North-Eastern Botanical District, where it occurs growing in rock beneath shrubs, from sea level up to nearly 3,000 feet; so whilst the species is widely distributed, the variety is limited to a restricted area. Dr. Cockayne gives the assurance necessary before we risk the planting of an Epilobium in the rock garden that there is no fear of this plant becoming a weed.

* *Notes on N.Z. Floristic Botany.* By L. Cockayne. *Trans. N.Z. Institute*, XLIX, 1916.

Newcastle Flower Show.—The Botanical and Horticultural Society of Durham, Northumberland and Newcastle-on-Tyne will hold a flower show in the Leazes Park, Newcastle-on-Tyne, on Tuesday, Wednesday and Thursday, September 2, 3, 4, 1919. Particulars may be obtained from the Secretary, Mr. R. H. Newton, 90, Pilgrim Street, Newcastle-on-Tyne.

The Influence of Nitrates on Nitrogen-fixing Organisms.—The Bulletin of the International Institute of Agriculture contains an interesting summary of observations on the effect of nitrates on the numbers and efficiency of nitrogen-fixing soil organisms. These observations show that small quantities of potassium, of sodium, or calcium nitrate lead to a great increase in the numbers of Azotobacter—one of the chief of the nitrogen fixing soil-organisms—in previously sterilized soil. It is curious, however, to learn that wherever small quantities of potassium or sodium nitrate also cause Azotobacter to fix more nitrogen, calcium nitrate reduces the rate of nitrogen fixations. All three nitrates appear to cause an increase in numbers of the nodule organism Bacillus radicicola. Noteworthy, also, is the fact that large amounts of potassium, sodium, or calcium nitrate, prevent the formation of nodules by Alfalfa, an indication of the truth of the suggestion already made that the origin of the symbiotic association between the nodule organism and the roots of Legumes is to be sought in the general nitrogen hunger which prevails throughout much of the world of living plants.

Leptospermum scoparium with Double Flowers. — Two records of double-flowered Leptospermum scoparium Forst, occurring in Nature, have been published already: to one reference is made in Dr. Cockayne's volume on New Zealand Plants and their Story (p. 149). This form was discovered by Mr. E. Phillips Turner in the Volcanic Plateau Botanical District. A second double-flowered plant was found about four years ago at Torrent Bay, Nelson, and of this find Dr. Cockayne was informed by Messrs. Nairn and Sons, nurserymen, of Christchurch. Dr. Cockayne has now recorded* a third form, which was found by Mr. L. H. Wilson in his property at Port Levy, Bank's Peninsula. An excellent photograph shows that the double form is an admirably decorative plant. It should be widely distributed from cuttings which have been struck, for a vigorous specimen is now growing in the Christchurch Botanical Gardens. Dr. Cockayne proposes for it the garden name of L. scoparium Leonard Wilson.

Revision of Pritzel.—By a slip of the pen, the volume entitled *Iconum botanicarum Index* was, on page 154, twice referred to as *Icones plantarum*.

ODONTOGLOSSUM AJAX.

THE beautiful seedling Odontoglossum Ajax, illustrated in Fig. 71, was shown by Messrs. Armstrong and Brown at the meeting of the Royal Horticultural Society on the 25th ult. The variety was one of two examples of this handsome cross between O. amabile (crispo-Harryanum × crispum) and O. Promerens (crispum × eximium) with their first flowers, which at first sight seemed very dissimiliar, the variety Armstrongiae having more of the characters of the blotched O. crispum, the markings being fewer, darker reddish claret colour, and with a clear white ground, while the form illustrated in Fig. 71 was cream-white with a pale yellow tinge, showing less of O. crispum, which had played the leading part in its production, and in the markings and tint gave distinct traces of O. Harryanum, its remote ancestor, passed on through O. crispo-Harryanum. A close examination of the flowers of both varieties, however, proved very interesting, for the pattern, if it may be so called, though varying in colour and breadth, was exactly similar in every detail in each flower.

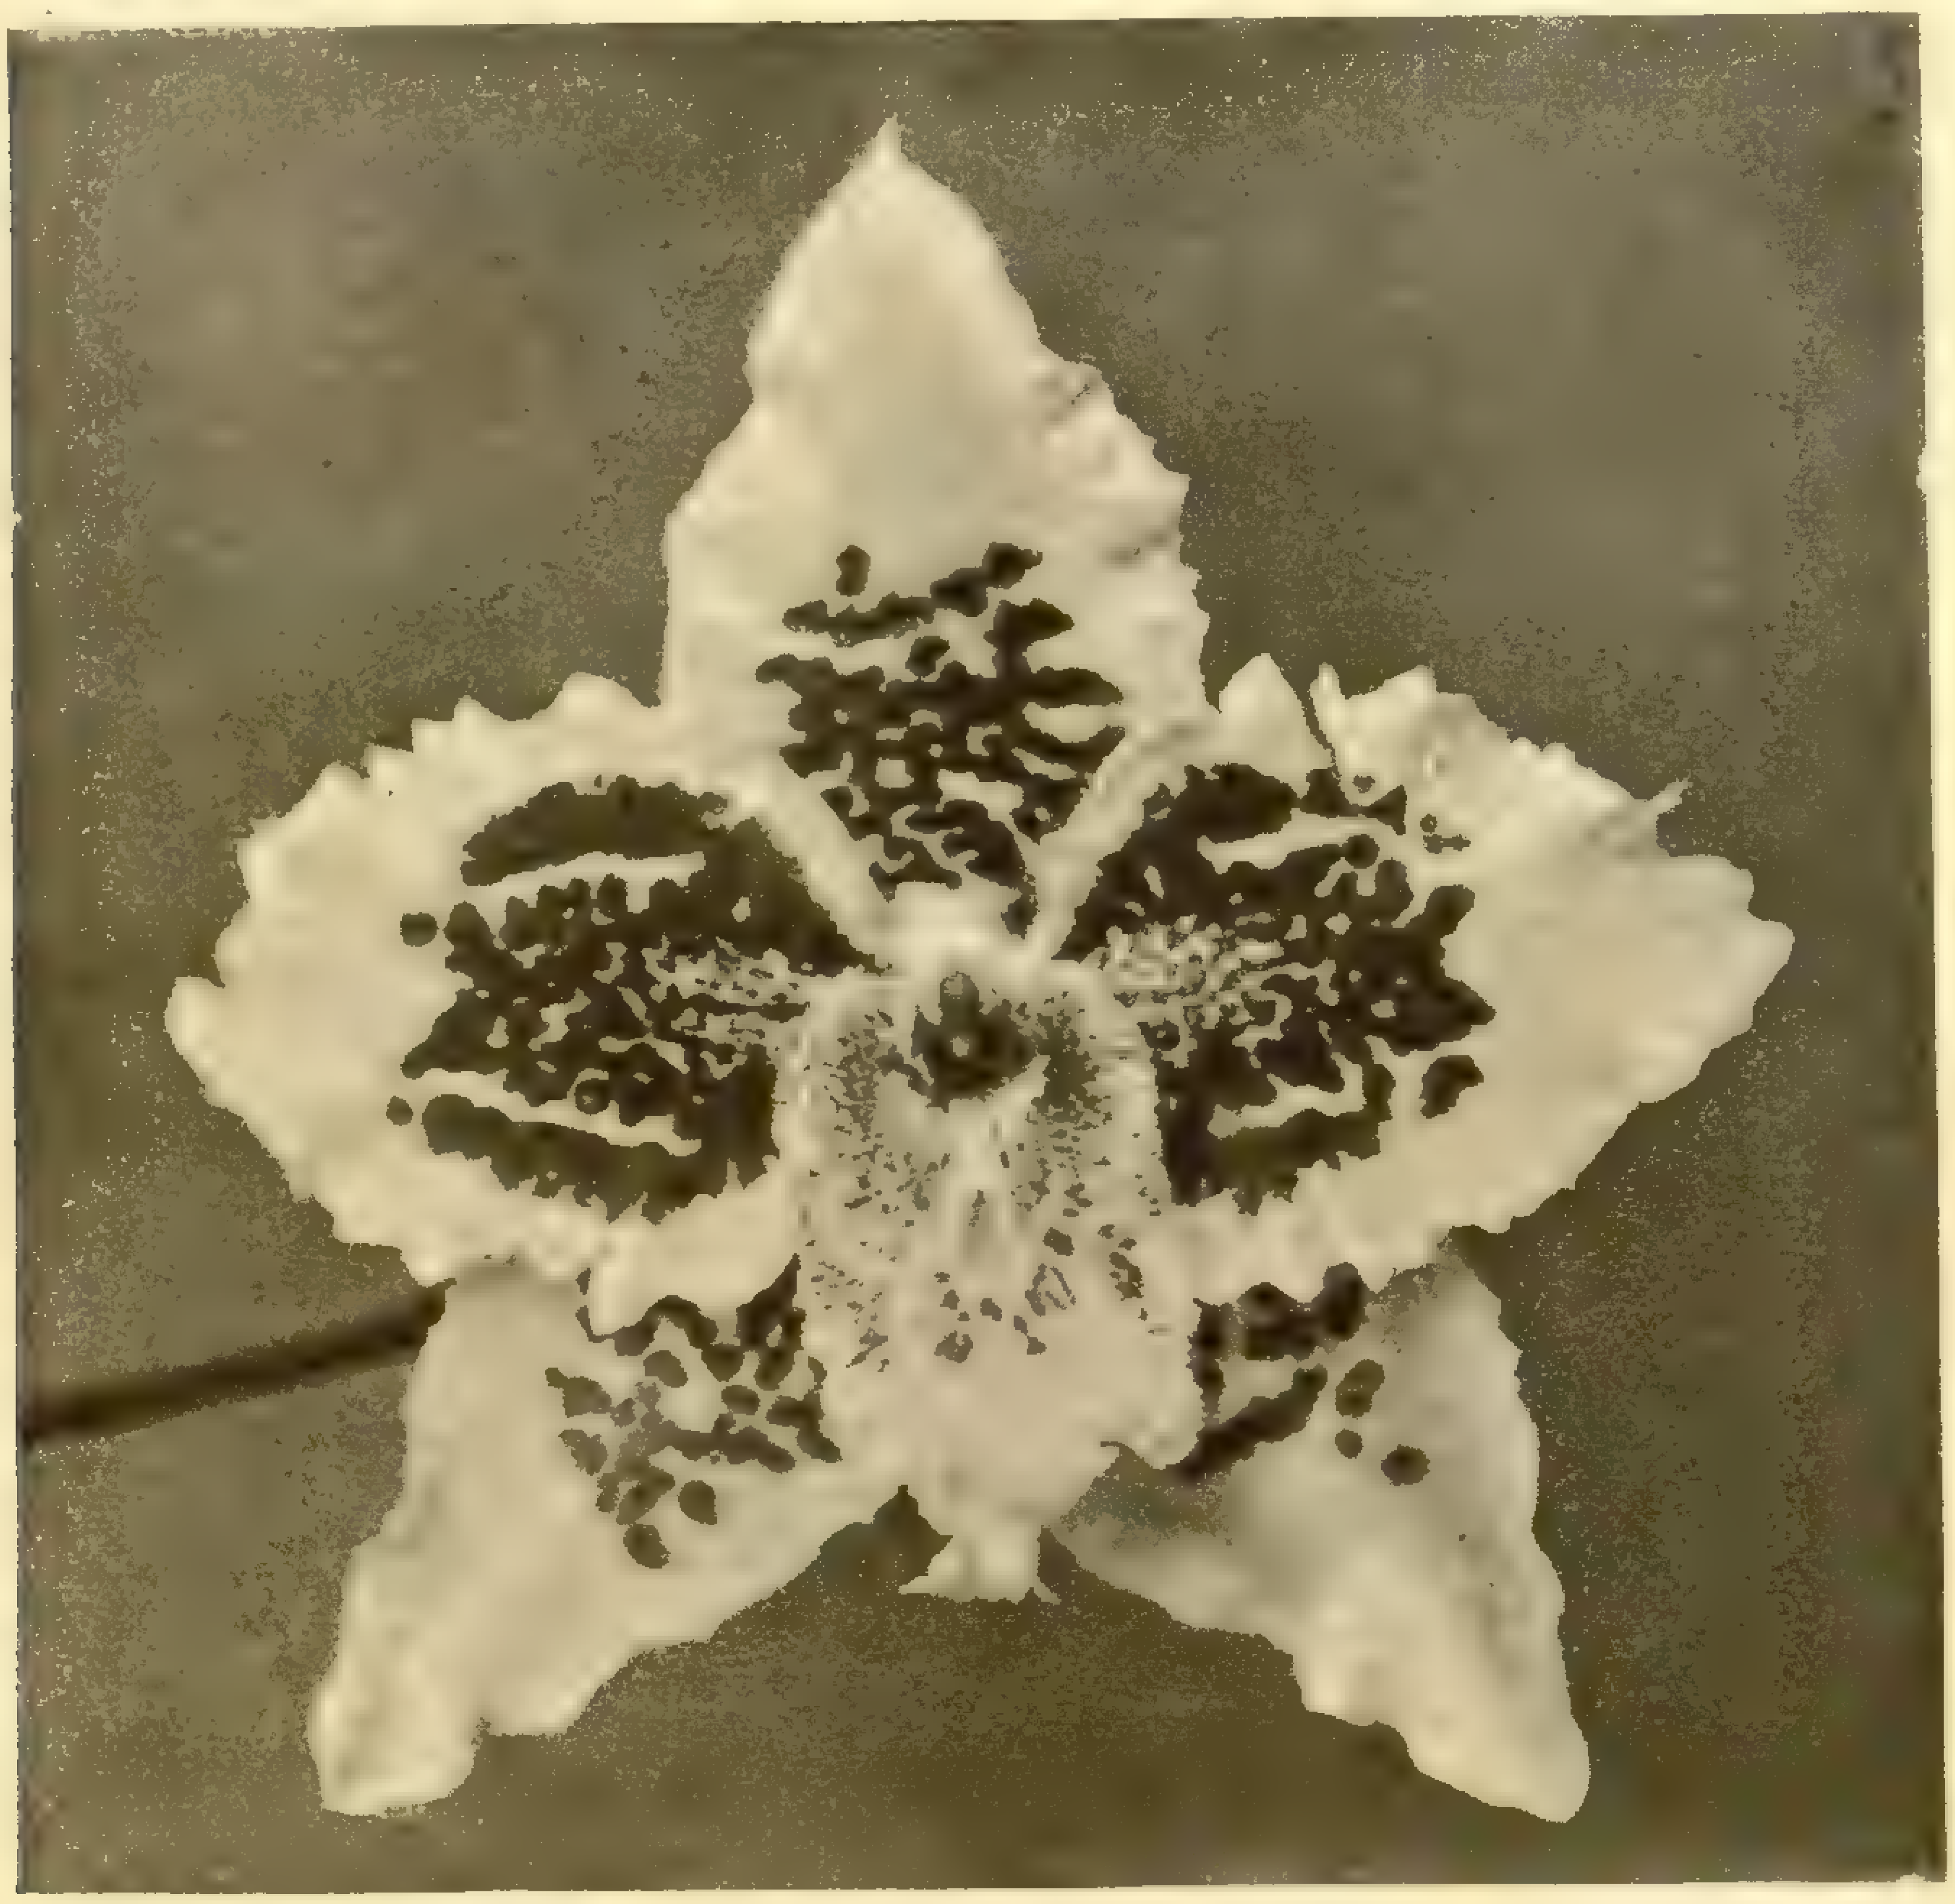

FIG. 71.—ODONTOGLOSSUM AJAX.

EMPLOYMENT IN AGRICULTURE DURING THE WAR.

Soon after the establishment of the Agricultural Wages Board, in the autumn of 1917, the Board of Agriculture and Fisheries instituted an "Inquiry into Wages and Conditions of Employment in Agriculture." A survey of wages and conditions of employment was conducted in each administrative county in England and Wales, and the results of these county surveys have now been published,* together with a general report on the inquiry, prepared by Mr. Geoffrey Drage and his investigation staff. We take the following interesting summary of the report from the *Wages Board Gazette*, March 15, 1919:—

The subject of wages and conditions of employment in agriculture is one which has aroused much public interest in recent times, but no public inquiry on the general subject had been made for over twenty years. The most recent inquiry was that made by the Board of Trade on Wages and Earnings in Agriculture in 1907, but this dealt with wages and earnings only, and the most recent information of a public character on other conditions was that obtained by Mr. Wilson Fox in 1899 and 1902. To find a parallel inquiry to that conducted for the Board of Agriculture in 1918 it is necessary to go back to the Royal Commission on Labour, 1892-4. It is interesting to note that the secretary of that Commission, Mr. Geoffrey Drage, was director of the investigations carried on by the Board of Agriculture in 1918.

In the general report, the subject of wages and conditions of labour is approached through an introductory survey of the general aspects of the agricultural industry. Here the types of agricultural production prevailing in different districts are indicated, and the relation of the prevailing type of production to the number of persons employed and general conditions of employment is discussed. Attention has also been given to some specialities in farming, such as market gardening, fruit growing, seed growing, etc., and to the existence of woodland, and to their influence on conditions of employment. In this connection an interesting summary of information on existing rural industries is given, with some discussion as to the possible success of schemes for developing such industries. The existence of other industrial enterprises and their effect on the supply of labour and conditions of employment is also dealt with. It is impossible to summarise this section of the report, but it provides a necessary and valuable introduction to details of conditions of employment which appear in later sections.

A section dealing with the supply of labour contains all the recent statistics of the numbers of persons employed on farms, market gardens and woodlands. Some figures showing the number of workers on groups of farms, or on farms in certain localities, in 1914 and 1918, collected in the course of the inquiry, are also given. It was found that on groups of farms in Oxfordshire, Buckinghamshire, and Northamptonshire the supply of labour had fallen 7, 20, and 25 per cent. respectively since 1914. It is also pointed out that the general shortage of labour has not been equally distributed, for more labour is now employed on some farms than in 1914. "Although the average shortage is known the variations in distribution are of more than ordinary importance, because the present supply of labour is not by any means always below that of normal times. It appears that an acute shortage brings out sharp distinctions between those employers who are keen to maintain their businesses at the highest level . . . and those who are more or less negligent and are unwilling to meet the changing demands of the moment." The subjects of juvenile labour, and the supply of women labour, with the prospects for the future, are also discussed. An interesting part of this section deals with the efficiency of farm labour. The human qualities and capacities necessary for efficiency are discussed, both in relation to the farmer and the workman. The comparative physical basis of efficiency in farm workers and those in other industries is treated statistically, and it is shown, amongst other items, that the age level of agricultural workers is not so conducive to efficiency as that prevailing amongst certain groups of industrial workers. It is eventually stated, however, that the productive capacity of farm workers is now higher than it was in 1871, a time at which the supply of farm labour is sometimes said to have reached its highest quality. Some local variations in productive capacity are also indicated, and reasons for local variations in the standard of efficiency are discussed.

The section dealing with the conditions of employment provides much detailed information of a kind not hitherto available. The conditions of employment of shepherds, cattlemen, horsemen, and other workers, including women, are treated separately. The relative advantages and disadvantages of various conditions of employment, and the effect of the labour position arising out of war conditions, are also discussed.

The subject of wages and earnings is treated separately, and tables are given showing rates of cash wages for men of each class in each county for the summer and winter of 1914 and 1917 and the winter of 1918. Some interesting details indicate the comparative increase in cash wages in counties which are predominately arable and others which are predominately pasture, and it is shown that the increase since 1900 has been more rapid in arable than in pastoral counties. It is also shown that wages have not risen as rapidly in counties in which comparatively small farms prevail as in those in which farms are larger. Ample details are given of the nature and amounts of allowances in kind, and also of extra earnings of workers in each locality.

Other sections of the general report deal with cottage accommodation and rents, the relations between employers and employed, gardens, allotments, and small holdings. Amongst the suggestions made in the conclusion drawn from the evidence relating to cottage accommodation and rents are these—that a serious effort be made to cheapen the cost of cottages, that the labourer should be put in a position to pay a reasonable rent, and to pay the rates on it. The relation of the landowner and local authorities to the rural housing problem is also discussed. As regards the relations between employers and employees, it is stated that "on the whole, labourers and farmers have realised the national importance of their work, and the extent to which harmony between them is needed, and have in most cases pulled together." The economic and social values of cottage gardens and small allotments is discussed at length, and, after a statement of the advantages and disadvantages of small holdings in relation to varying types of agricultural production, it is suggested that "there are advantages in the small holding and the small farm which, looked at from the point of view of the benefit of the country at large, and of agriculture in particular, probably outweigh the cash gains of the organisation of larger farms." As regards the economic position of

* *Wages and Conditions of Employment in Agriculture*, Vol. I. General Report, Cd. 24, 1919. Vol. II. Reports of Investigators, Cd. 25, 1919.

the farmer and labourer, it is stated that "incidental circumstances seem to show that if farming profits have not been greatly increased on the whole, they have at least, so far, been well maintained," and that "it may probably be concluded with safety that, taking wages and prices together, those agricultural labourers who are left on the land (in the spring of 1918) have never been so well off as they are now," but that to say this "is not, of course, the same thing as saying they are as well off as they ought to be."

The summary of the reports on Wales is given separately, and will be found to contain a large amount of interesting materials, especially when a comparison of conditions of employment in Wales and England is made. The second volume of the reports contains the reports of individual investigators on conditions of employment in the counties which were assigned to them. These reports deal in great detail with wages and conditions of employment, and also throw illuminating sidelights on many aspects of rural life in England and Wales. They provide an interesting record of some conditions prevailing in the agricultural industry during the war, indicating many changes which have occurred; but they also contain much information on some features of the organisation of the industry which have endured, and will endure, for a considerable length of time.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Women in Horticulture. — Being another woman-gardener, I should like to add a few words to those of "*A Possible B.E.*" The women have certainly been judged far more harshly than the men. It is quite permissible for a man gardener to straighten his back and lean on his spade for periods varying from ten minutes to three-quarters of an hour, several times in a day. Also to smoke a pipe in some quiet corner, and never be missed. What happens if a woman gardener is seen taking a breathing space of five minutes? Does "*Dubious*" realise how the women have roughed it? The fearful bothies, lack of all conveniences and sanitation? Almost invariably where three men have been kept inside, two girls have been expected to do the same amount of work, and obtain the same results on old stock (economy forbidding the purchase of new stuff), insufficient heat (fuel being expensive and hard to obtain), and they have sustained the effort for at least four years. What about stoking?—surely a hard task for any woman. Yet the women have been expected to turn out at all hours during winter nights to stoke three, four, or even five fires, and have done the work for several winters. There have been no excuses if "temperatures" have been down in the morning, yet one hears of men who, in pursuit of pleasure, have allowed fires to go out and the plants to be ruined. Few of the despised women gardeners have done that. What is the reward for their efforts to carry on in the absence of the men? They are receiving their notices, unjustly in most cases; are being given no references, and have no chance of continuing the work, which most of them love, and which, to not a few, is their only means of livelihood. Men will come back to better and cleaner bothies, clean plant-houses, and more consideration, while the women-gardeners, who kept on at times when "there was nothing left except the will to 'hold on,'" are being "sacked," and are left wondering why they have been such fools. *(Miss) A. Parker.*

The late Mr. G. Neve (see p. 146):—May I add a word of tribute to the late Mr. G. Neve, as an old friend and neighbour: Mr. Neve was a hard and constant worker both for the welfare of the village, the institute, the school, and the flower show; and on two occasions he and Mrs. Neve received presentations in recognition of his good work. He did his best to leave the world better than he found it. The late Mr. G. Harman, his employer, treated him as a friend. Besides lecturing and adjudicating at various flower shows, Mr. Neve was for two successive years chairman of the Reading Gardeners' Association and a prominent member of the Reading Flower Show Committee. *J. Prince.*

Gardeners' Victory Memorial.—The suggestion of Mr. Beckett (p. 129) to place the names of the fallen members of the garden staff on a tablet fixed to the garden wall in establishments where the heroes spent part of their career, is one which most gardeners will fully approve of. Two most promising young gardeners who passed through Mr. Beckett's hands, and whom I had the pleasure of knowing, were Mr. Gardiner and Mr. Scrivener. Both gave their life for their country. *Cymru.*

——At present there are three proposals for a Gardeners' "Victory" Memorial. (1) A tablet in the hall of the Royal Horticultural Society and Memorial Funds for the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund; (2) A tablet on the wall of each garden where the men worked before joining the services; (3) A colony of Rest Houses for aged gardeners who are unable to work. All three are good suggestions, but number two appears to be one for individual gardens only, and not suited for a national memorial, as no committee could ensure its being carried out. Many who have assisted me in years gone by have made the supreme sacrifice, and I shall be glad to give any assistance in my power to any scheme that is decided upon. A committee should be appointed to consider the above suggestions with any others that may be made, and recommend the adoption of the most suitable scheme. Out of 600 members of the United Horticultural Benefit and Provident Society who joined the services, 100 lost their lives; these men and a large number of other gardeners who were not members, nobly gave their all in order to shield us from dangers worse than death; the least we can do in return is to perpetuate their memory. *W. H. Divers, V.M.H., Westdean, Hook, nr. Surbiton.*

The Recent Severe Frost.—With reference to readings of temperatures below zero recorded by your Aldenham correspondent during the month of February, I may state that the lowest temperature registered here this winter by my thermometer, on the grass, facing N.E., was 14° Fahrenheit, or 16° above your correspondent's figure, a difference which, at a distance of only 8 miles, appears quite unaccountable. The lowest temperature I registered during the winter of 1917, was 12° Fahrenheit on three occasions. *M. T. Allen, Ravenswood, Northwood, Middlesex.*

Field Mice and Voles (see p. 134).—It was on the Amazon that I learnt the use and technique of carbon di-sulphide in dealing with the Saüba ("Sahoovah") or "umbrella ant," perhaps one of the most rapidly destructive pests that is known. The method was to pour or squirt down the liquid into the holes of the "ant-warren," a short time for diffusion was allowed, and then a burning bunch of oily tow was applied on a long stick. Various explosions and rumbling followed, and I saw no saüba for some 3 or 4 weeks, and then only a scattered few. Some 12 years ago a friend's garden was being cleared by mice, which had established a warren in a grass bank. We got petrol, a funnel and the kitchen bellows, and so got the petrol vapours well into the burrows. On applying the light, spurts of flame occurred out of the bank over an area of many yards; thereafter the mice ceased their depredations. I have often thought that a cylinder of compressed coal gas might be used where suitable burrows exist, but, of course, too, one could use an ordinary acetylene generator. As a mere poison gas, without the aid of explosion, I have used arsine, or arseniuretted hydrogen; in a room this is a dangerous gas, but in the open air in responsible hands there is probably no risk. It has the advantage of being very much heavier than air (2.7 times), so that it tends to fall and fill depressed holes. A small, wide-mouthed bottle is provided with a bored cork and bent tube, to which is attached a piece of rubber tube; a few pieces of zinc and some suitable arsenic compound (*e.g.*, white arsenic) and water are put in the bottle, the end of the rubber tube is introduced into a hole and earthed up around in the case of a mole run (which are often used, I believe, by the mice). I invert a small flower-pot over the tunnel so that thoroughfare is not impeded; the pot is earthed up around and the tube inserted through the hole and clayed in, thus the gas passes in both directions (the mole ceased further working). A teaspoonful or two of strong hydrochloric acid is rapidly poured into the bottle, which is immediately re-corked; the gas goes into the holes, and if the burrows have been well designed by the mice, any that are therein are certain to die; the last mole I had in the garden ceased signs of activity after one gassing. Deterrents such as Dippel's oil are of limited use, as destruction is the main object for success. Some of the poison gases employed in the war might be useful. Two neighbours recently reported to me that young Apple trees heeled in have had the bark and small roots eaten off, and Rhubarb crowns hollowed out, the latter by voles. With regard to seeds, it appears that the mice (I use a general term as I am not sure of what species they are) do not eat them directly, but carry them off to hoard. Thus on lifting some Seakale pots some years ago, I found the whole of a sowing of Peas germinating in a pile, intervened with a trowel, put them in place again and had a crop from them after all; another hoard occurred of frame-sown Radish, so now with these sowings I put a rag soaked with Dippel on a piece of wire in the frames, and this seems successful, as another frame without Dippel only shows some half-dozen seedlings appearing. Lettuce seed is eagerly sought, and I think directly eaten. One of the most curious hoards I have met with was with some Maize cobs ripened for seed lying in my fruit-room. To my horror one day I found that mice had been there and stripped nearly all the seeds off; later in the year I went to a box full of a special Carrot seed that I had saved, and to my surprise the Maize seeds were there buried in the Carrot seed. This winter there was some Buckwheat lying loose and a piece of sacking on the staging above: nearly all the Buckwheat had been transported within a fold of the sacking. Lastly, a word as to "natural enemies," there are several cats around and plenty of owls fly about hooting but neither does anything, apparently, to the mice, which continue to increase. *H. E. Durham.*

Gardeners' Hours and Wages.—Mr. Chivers' argument that because a boy joins the Army at 18 he is therefore entitled to all the privileges of manhood, including full wages, is utterly beside the mark. The two things have no connection whatever. The fact that thousands of boys have taken their place with the men and done their duty nobly would be ample reason for rewarding them, but it is no justification for the attempt to secure for others a remuneration they cannot earn. I am, of course, referring only to commercial horticulture, with which I am concerned, and not to gardening, to which the Act does not apply. I repeat that the clause referred to is based on utter fallacy and is resulting in injury to all concerned. In commerce, wages must depend upon output. Mr. Chivers appears to share the all too common delusion that they fall like the rain from heaven, whether earned or not, and are not subject to economic laws. It does not need much argument to show that no man can long continue to draw more money for his labour than what he produces will fetch on the market. If he does not produce enough to pay wages (and some margin beyond) his employment will soon cease. Under present conditions boys of 18 cannot, excepting in rare cases, earn men's wages, so that we are faced with the prospect of doing without boys, or, as an alternative, the Government must act consistently, and, in classing nursery and all other land work as "agriculture," treat the employers as they have done the farmers, and, by maintaining prices, supply the means to pay an artificial rate of remuneration to the workers. Of course in this case the public will pay, and probably grumble,

but there is no other reasonable way out of the difficulty, unless they acknowledge that a mistake has been made, and repair it. *Chas. E. Pearson.*

——The anomalies and difficulties calling for discussion cluster around the three heads: wages, hours, and overtime pay. The *Wages Board Gazette* has expressed the opinion that the 30s. minimum does not apply to labourers gardening for purely private ends. The B.G.A. is asking from 2s. 6d. to 30s., according to experience and status, *above* the agricultural minimum. Leaving this standard for the moment, of what use is it for a head gardener to offer capable labourers *less* than the minimum which is being paid on the farms around him? He cannot get, much less retain, men worth retaining for anything under 30s., because of the impossibility of supporting their families on less. Applied to hours, the same argument holds good. How many garden workmen will work longer hours than a workman on a farm? These are practical points some of us have had to consider. The argument holds good again when dealing with overtime and Sunday work. Of what use is it, to-day, to expect anyone engaged in a garden—from the boy upwards—to work gratis on Sunday and in the evening (as some of us older folks had to do), when the employer has to pay for such work on the farm? Since the passing of the Agricultural minimum, I have noticed gardeners offering 3s. for Sunday duty; and yet farm work on Sunday is remunerated at 10d. to 11d. per hour, according to the county rate. From the foregoing comparison it looks as if gardening, from the financial point, is on the downward grade. Happily, however, there are a few places where Sunday labour receives just recompense: two such I have in mind now, one paying 9s. for Sunday duty, the other 6s.—these sums being halved for half-day work. Some such authoritative voice as the Royal Horticultural Society is needed to plead for and give support to the just claims of all workers in private gardening for a more liberal monetary reward for their services. It may be asserted, surely, that no art or profession has more enriched our land than gardening. None has a more educative and uplifting influence. Should not those engaged in it be better compensated, from the humblest to the highest?—*C. Turner, Ampthill Park Gardens.*

——Mr. Elwes (see p. 144) puts the case for employers of gardeners, who, like other employers, pay no more than they are forced to. My appeal was made to gardeners to combine for the purpose of exacting reasonable conditions of employment. Without combination, betterment is impossible. If one of the results of the war will be the application of the skill of the trained gardener to the cultivation of plants of economic importance instead of so many things which, as Mr. Elwes says, we should be just as happy without, the country will benefit. Owners of large gardens and parks must make better use of them. Clap-trap is no doubt served out in Glasgow and South Wales as it was formerly in Birmingham and Limehouse, and it is surprising how it sometimes serves the purpose intended. But Mr. Elwes knows quite well that the feeling against the waste of land in this country is strong and genuine. Sir Thomas Middleton, Assistant Secretary, Board of Agriculture, recently stated, in a paper on "Food Production," that land is a prime instrument of production, and must be put to its fullest uses. "If the British public once give their attention to the products of the land they will insist on an increase in the quantity of food: there will be but little sympathy for the man who comes forward with the excuse: 'Knowing that thou art a hard taskmaster, my one talent lies buried beneath the grass'; the grass and the talent will both come up and will pass to the man prepared to multiply production tenfold." Large private parks and gardens are certainly not put to the fullest use; they are, in fact, largely ornamental, and it does not require much imagination to enable one to see what might be done with these enclosures in the way of production. As to the expense, rent, rather than the cost of labour, is likely to be the serious obstacle, judging by the demands made when land is required. Farm land ought not to be interfered with until such places have been released and put under cultivation. Whilst it is to be deplored that gardening has become a luxury, and that the gardeners' efforts are wasted in growing things of no real use, that is no reason why gardeners should be cheap. On the contrary, luxuries are usually extravagant in price. Those who waste labour should, in my opinion, be taxed for it. Land in this country should not be left idle; labour should not be used in vain. If, as Mr. Lloyd George has stated, "the vital needs of the country are to be produced from our own soil and factories," cultivators, be they farmers or gardeners or foresters, will become as necessary as miners, engineers and factory workers, and they must not, therefore, be overlooked with respect to wages, hours and other conditions. I object to the argument that gardeners must take what they are offered and be satisfied. They should hasten to follow the example of other workers by combining and insisting on fair terms. Farm-workers are advancing. They are now agitating, through their Union, for a minimum wage of 50s. and an eight hours day. It has been decided that gardeners occupied in the cultivation of useful crops, such as fruit and vegetables, are entitled to the terms awarded by Government to farm-workers. Generally they are worth more, and it is to be hoped that their claims will not be overlooked by the Chamber of Horticulture, otherwise there may be trouble. The great need now is a Union of Gardeners, to act independently of societies and employers, for the purpose of creating for the workers in the great field of horticulture a status among the important industries of this country. *W. W.*

——I read with interest the correspondence in your columns on the above subject, and especially the letters from Mr. Chivers, with whom I cordially agree on most points. I must, however, take strong exception to his statement in your last issue that gardeners should join other unions than a Gardeners' Union. Mr. Chivers is apparently not aware of the progress of the British Gardeners' Association since the conclusion of the war, and of what has been done in connection with improvements in conditions and wages. If Mr. Chivers will let me have his address I shall be pleased to give him some interesting information. With regard to the suggestions of Mr. H. J. Elwes that the gardener is a luxury, I thought that myth had been exploded years ago. A gentleman of my acquaintance at Croydon who formerly held this opinion until his gardener joined the Army, has now changed his mind, chiefly owing to the fact that his greengrocer's account comes to over £5 every week. Even where no vegetables are produced the market value of the house is determined very largely by the amenities which surround it. Last, but not least, even if one admits that a gardener is a luxury, that does not justify employers in paying sweated wages. I know of many cases, and can give the necessary proof, where wages have advanced not more than 2s. since July, 1914, and this notwithstanding that according to the Board of Trade official figures, the cost of the necessaries of life is 120 per cent. higher than it was in July, 1914. If Mr. Elwes would visit some of the gardeners' homes and some of the bothies he would appreciate the humour of "The Glory of the Garden." With regard to Mr. C. Pearson's alarming picture of the boys of 18 adrift, I shall be pleased to hear of any cases of this sort, and can guarantee to find these lads employment where they can obtain wages according to the minimum laid down by District Wages Committees. Mr. Pearson calls the Corn Production Act clause idiotic. It might be from an employer's point of view, but when one remembers how the labour of school children and young people has been used for the purpose of keeping down wage bills, one will realise the necessity for this clause. *Cyril Harding, General Secretary, British Gardeners' Association.*

CROPS AND STOCK ON THE HOME FARM.

Cabbage.

Seed of both early and late Drumhead cabbages should be sown about the middle of April. The early variety will be ready for use in September at a time when grass may be scarce and the maize crop a failure as it sometimes is from various causes. In those circumstances cabbages are invaluable for producing huge crops of valuable food and especially for dairy cows. Thirty tons per acre is not an extravagant estimate of a good cabbage crop: 1 lb. of seed will provide enough plants for six acres provided they are well grown and carefully put out.

The seed bed should be in an open situation, the soil deeply dug and well manured; a fine tilth is necessary to ensure even germination. Previous to sowing the seed, scatter superphosphate freely over the ground to give the seedlings a fillip in their early growth. Sow the seed thinly in drills made one foot apart, which distance enables the soil to be frequently stirred, as hoeing hastens the growth of the plants and keeps down weeds. When the plants are large enough to handle they should be put out; it is a mistake to defer transplanting until they become leggy, as large plants receive a considerable check in transference. In stiff soil I prefer to plant cabbages during dry weather as they start into growth much better than when planted during a continuance of wet weather. The early variety I plant in the second plough furrow; the later sort is given more space in the third furrow. Before planting, dip the roots in a thick solution of soil and superphosphate or soot and water, which may assist in warding off an attack of club. If there is any suspicion of this disease, the soil should be dressed with gas lime at the rate of two tons per acre in the autumn before ploughing.

The Wheat Prospect.

Where this cereal was sown in October, enabling the seedlings to get a good start, the plant has a promising appearance, being thick, deep green in colour, with a good promise of tillering. The month of November was fairly dry in South Hants, but 3½ inches of rain fell, which enabled the early sown wheats to make good progress.

That sown later had much worse weather to contend with, as but ten dry days were recorded in December. January was even worse, although eleven dry days were experienced, for as much as 6.46 inches of rain fell during the month, which was detrimental to the growth of wheat.

Many fields of late sown wheat are not looking promising; some are so bad they should be ploughed and the land re-sown with oats, which would be better than risking half a wheat crop. The previous preparation will be all in favour of a good yield of oats or barley. Some thin wheat plants often surprise the farmer by their quick alteration in appearance after a spell of dry weather at the end of March and early April after the surface has been harrowed and dressed with some quick acting fertilizer; therefore do not be in too great a hurry to plough up the wheat. Even if too late for oats or barley, before a decision to plough is taken, an early crop of rape, vetches or turnips could be sown to provide sheep-food, and this would improve the ground for an early sown wheat crop.

Although sulphate of ammonia will quickly alter the appearance of the wheat plant, I think it is too late to apply this fertiliser now; a special wheat fertiliser or superphosphate would be preferable sown at the rate of 4 cwt. of the former and 3 cwt. of the latter, per acre, before harrowing.

Mangold.

Another season has proved the value of mangolds as food for cows, and especially for sheep, when the crops of turnips and swedes were but poor in either number or quality. Mangold will give the heaviest yield of all root crops on the farm. With ordinary good cultivation

30 tons of roots per acre is a reasonable crop, and by special cultivation and superior varieties, 60 tons per acre is not a maximum crop. This season mangolds have sold freely at £2 per ton, which, apart from their value for home food, cannot be other than a very remunerative crop. The third week in April is a good time to sow the seed, therefore the land should be thoroughly prepared to obtain a suitable tilth. The seed germinates much more evenly in fine soil than it does in rough or cloddy ground, owing to the escape of soil moisture from the latter.

Where the soil is stiff, was well manured and was ploughed in the autumn, with a promising tilth it should not be ploughed again. Owing to the risk of the lower soil being in a wet condition, this would come to the surface in an uncongenial condition, and with the drying winds and sun we can reasonably expect would be rendered difficult to work to secure the necessary tilth. Therefore such soils should be cultivated on the surface to destroy weeds and make them level.

Where the soil is light in texture and not liable to give trouble by ploughing it should be finally turned over, burying any surface weeds and providing a good tilth. Although a dressing of farmyard manure, at the rate of 20 tons per acre, is invaluable for the mangold crop, those who have not that commodity need not despair of a full crop, as with 4 cwt. per acre of some specially prepared fertiliser or superphosphate success may reasonably be expected. Sulphate of ammonia renders most valuable aid in the growth of this crop after the plants are hoed out. My recent experience with this crop justifies my saying that 1 cwt. of sulphate of ammonia per acre sown broadcast at the time of drilling the seed gives a fillip to the growth of the plants directly the seed germinates, bringing them on more quickly for "setting out," and ensuring a more regular "plant."

I sow the artificial manure broadcast when preparing the soil by harrowing previously to sowing the seed, in preference to sowing it from the drill with the seed, as I think the manure retards the germination of the seed somewhat. Since adopting this plan of broadcasting the artificial manures and the use of sulphate of ammonia at sowing time, I have had better results, especially in a more even, regular "plant." *E. Molyneux.*

Feeding of Livestock.

It is announced that no further certificates will be issued by the Food Controller for the purchase of oil cakes and meals, and these may now be purchased freely wherever they are available, but whenever supplies are not equal to all the demands, purchasers requiring them for milch cows will be given a preference. Except as regards the manufacture of malt, there is no longer any restriction on the use of barley, and no licence is required for the feeding of damaged grain. Dredge corn may be fed for any purpose, and horses are not now restricted in the quantity of Oats, Maize, Beans, and of the other cereal foodstuffs (practically everything except Wheat) that may legally be fed to them. Millers' offals are now available in greater quantity and of better quality, and may be obtained from the London mills in lots of not less than 4 tons at £14 for fine and £13 per ton for coarse offals, including delivery to buyer's nearest railway station. Sacks are charged for. Early application should be made to the Feeding Stuffs Section, Ministry of Food, New County Hall, London, S.E.1.

SOCIETIES.

ROYAL HORTICULTURAL SOCIETY.

Scientific Committee.

March 25.—*Present:* Mr. E. A. Bowles, M.A. (in the chair); Messrs. W. Hales, W. C. Worsdell, F. J. Chittenden (hon. sec.), and Rev. J. Jacob (visitor).

"Breaking" of Freesias.—Rev. J. Jacob showed examples of Freesia flowers exhibiting the same kind of phenomenon, so well-known in Tulips, of concentration of colour in certain areas, whereas the colour in flowers of the (vegetative) parent corm had been diffused. The example shown was in the variety "Whitewell," where the delicate tint of the parent had become intensified within a smaller area, and was not nearly so pleasing. He was unable to account for the change by any differences in cultivation or other causes.

Fruiting of Hedychium Gardnerianum.—Mr. J. Fitt, Frythe Gardens, Welwyn, Hertfordshire, sent a shoot of Hedychium Gardnerianum bearing fruit. At ripening, the fruit (which has been enclosed till then within the valves of the spathe) is exposed and its bright red valves burst apart, showing the black seeds on a red column within. The fruit is about 1 inch in length.

Obituary.

Jesse Willard.—We announce with deep regret the death of Mr. Jesse Willard, for 45 years gardener at Holly Lodge, Highgate. Mr. Willard died on the 27th ultimo, aged 85 years, at Reigate, where he had lived since his retirement from service some ten years ago. He was born at Hawkhurst, Kent, and at the early age of twelve years commenced his career as a gardener. After a little

THE LATE JESSE WILLARD.

experience he obtained employment at Hunton Court Gardens, Maidstone, where he made good progress, and in time became foreman of the glass department. During this period he was keen on improving his education and general knowledge, and his abilities attracted the notice of a local nurseryman, who recommended him for a post at Holly Lodge, Highgate, the residence of the late Baroness Burdett Coutts. He had only been at Holly Lodge about a year when he was offered the post of head gardener, and after a time was given the management of the farm attached to Holly Lodge, so that he became bailiff of the whole of the Holly Lodge gardens and estate. It was no mean task to undertake the management of such gardens as those at Holly Lodge, which were famous throughout Great Britain on account of the gatherings there of famous men and women of the times. Not only was it necessary to maintain the gardens as a show place, but exotic fruits and flowers were required in abundance, as well as other things the garden is required to furnish for garden parties and other similar functions. At that time Pelargoniums, Fuchsias, and Heliotropes were fashionable bedding plants, and these and similar flowers were grown in large numbers to furnish beds and borders in summer time. Mr. Willard was as capable a farm bailiff as he was a gardener, and he had a high reputation amongst societies concerned with stock breeding, for the Baroness's herd of pedigree goats and Guernsey cows were amongst the finest in the country; indeed, the herd of Nubian goats at Highgate was the largest in Great Britain. Mr. Willard was well known to those attending the Royal Horticultural Society's meetings, and he had served as a member of the Fruit Committee for a great number of years. He was also a member of the Committee of the Gardeners' Royal Benevolent Institution for twenty years, and after 1888 he acted for many years as one of the auditors of the Institution. Mr. Willard was a man of outstanding integrity, and during his long service at Holly Lodge he endeared himself to a host of friends, for in addition to striking ability he had a charming manner and kindly disposition. It may be fitting to conclude this brief notice of a worthy man with the remarks made by his employer, Mr. Burdett-Coutts, at a dinner given in his honour on the occasion of his retirement from Holly Lodge: "I need not say anything about Mr. Willard's personal qualities. I shall miss him greatly. He has been a familiar figure to me in these grounds through all these years, and it will be a real loss not to see him here habitually, as in the past. I wish to add a small memento of my own in this inkstand. There is one word I have inscribed on it—'Friendship'—which perhaps illustrates better than anything else what I feel for you." The funeral took place on April 1st, at Highgate Cemetery.

Edmund Rochford.—We much regret to learn of the death of Mr. Edmund Rochford, of Holmehurst, Loughton, Essex, which occurred on March 28, at Forest Hospital, Buckhurst Hill, following an operation. Mr. E. Rochford was a member of a family that has become famous in commercial horticulture; he was a skilful cultivator of Grapes, Tomatos and Cucumbers, and grew these crops in very large quantities for the London markets. He was a liberal supporter of the Gardeners' Royal Benevolent Institution for thirty years. The funeral took place on Wednesday, April 2, at Loughton.

TRADE NOTES.

It is to be feared that many nurserymen have suffered so much financially during the war that their profits have been negligible. In a few instances, however, the temporary use of portions of their land for the purpose of food production has helped to alleviate the position, and those who have been fortunate enough to make a profit in excess of what they made during the pre-war period might find it worth while to bear in mind the decision of Mr. Justice Sankey in a case reported not long ago.

It will be remembered that the Finance Act of 1915 imposed extra taxation on the profits of every trade and business over and above what was made in that trade or business before the war. (At the moment of writing the Excess Profits Duty is 80 per cent., that is to say, for every £100 profit which is made in excess of what was made before hostilities commenced, the State takes £80 and the trader keeps the remaining £20 as his share.) The Act, however, allowed certain exceptions, and one of these was in favour of "husbandry." Consequently, the Excess Profits Duty is not payable in respect of profits arising from the business of husbandry.

In the case referred to above, the facts were that a limited company carried on the business of manufacturing chemists and growers of medicinal and other herbs. This company was the owner of a freehold factory in which the manufacture and distillation of herbs was carried on. With a view to maintaining a supply of herbs to the factory the company also held on lease a farm of about 40 acres. The company, for the purpose of their accounts, treated the factory and the farm as one concern, so that no attempt was made to distinguish between the profits arising from the growing of herbs on the farm and the distillation and sale which was subsequently made at the company's factory and offices. As a matter of fact, however, one of the directors made certain notes as to the value of the farm produce which was taken to the factory

and of the profits arising from the sale to the public of the incidental crops grown on the farm, as well as of the expenses of the farming operations. It was therefore possible to trace precisely what profits were attributable to the farming branch of the company's operations and what profits were made from the factory branch.

In due course the Inland Revenue authorities demanded Excess Profits Duty on the total profits made by the company. This claim was resisted by the company, who contended that the profits made at the farm were profits arising from the business of husbandry, which, accordingly, ought to be excluded from the claim.

On the matter coming before the General Commissioners for Income Tax it was held that the company were right in their contention and that, accordingly, the Crown could not claim Excess Profits Duty on that portion of the profits which was derived from the farming operations. The Inland Revenue Authorities appealed to the High Court, and Mr. Justice Sankey held that the Commissioners were right; he was of opinion that the evidence showed that the company was engaged in husbandry, and that as it was possible to separate the profits arising therefrom from the profits made by the factory, there was no reason why they should not do so. It would therefore seem clear by analogy that all businesses which carry on market gardening or farming can claim to be exempt from Excess Profits Duty in respect of those operations. Some London salesmen, for instance, sell on commission for country growers, and so far as that branch of their business is concerned they would presumably be liable to pay the Excess Profits Duty. On the other hand, they very frequently cultivate market garden land as an accessory to their business, selling the produce on their own behalf when it is ready for market. In this respect it would appear that they are not liable to pay the duty in question, and if the expenses of the business can be apportioned it would seem possible for them to allocate to their market gardens a reasonable proportion of the expense of conducting their London premises, as if the goods were not sold there they would have to be sent to some other salesman, who would, of course, charge the usual commission. Whether the Crown will consent to more being deducted for expenses than would be equivalent to the commission which would be payable if the produce were sold by another salesman would, however, seem open to question. In this connection it would be interesting to know whether seedsmen are being called upon to pay the duty in respect of the profits made at their urban offices, and if so, whether they are being allowed to deduct the profit resulting from the carrying on of their seed farms and trial grounds. *H. M. V.*

MR. D. W. SIMMONS has resigned his position as Superintendent of Parks and Allotments to the St. Albans City Council, and has taken up an important post on the technical staff of Messrs. Ryder and Son, Ltd., St. Albans.

At the works of Messrs. White and Poppe, Ltd., Holbrook Lane, Coventry, on the 31st ult., Mr. Robert Greenfield, land steward of Food Production Scheme, N.F.F. 21, was presented with a gold watch as a token of esteem and friendship from the members of the firm and staff on the eve of his departure to rejoin his old firm, Messrs. John Peed and Sons, seedsmen, West Norwood, as their Midland and Northern representative.

Mr. Greenfield has held the position of land steward for 2 years, and during that time has turned some hundred acres of waste ground into highly cultivated land, supplying three large canteens with their full daily requirements to feed upwards of 12,000 employees. Apart from this remarkable achievement, Mr. Greenfield, in the 2 years, made over 50,000 separate sales of vegetables to employees, supervised 16 acres of allotments and 200 munition girls' garden plots in the hostel grounds. He also managed a large piggery and poultry section, supplying canteens and employees with pork and eggs.

Mr. Greenfield organised and supervised three other Food Production Schemes at Barras Heath, Coventry; Lickey, Birmingham; and Blackheath, Stafford.

MARKETS.

COVENT GARDEN, April 2.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

		—— 60's ...	15 0–18 0
Cinerarias. 48's. per doz. ...	24 0–27 0	—Cocos	24 0–36 0

REMARKS.—Despite the cold weather the supplies are increasing, and there is a good show of flowering plants consisting of White Hydrangas, Acacias, Genistas, Marguerites, Cinerarias, Cyclamens, Primulas, Daffodils, Boronias, Azaleas, a few Rambler and Polyanthus Roses. Ferns are now in better condition and more plentiful, but the supply of Palms is limited.

Lilac, white, per bunch, 6's ...	4 0– 6 0	Violets, single, per doz. bun. ...	3 0– 6 0

REMARKS.—The supplies of cut flowers were not quite so plentiful during past week owing to the severe weather. This morning (April 2), there appeared to be a plentiful supply of home grown Daffodils and prices had a tendency to fall. Carnations are also increasing in quantity, and a few boxes of good Roses were left over at the close of the market this morning; some excellent blooms of Richmond, Prince de Bulgarie and Lady Clive are now offered. The best Pheasant-Eye Narcissus keep firm in price owing to the limited supply. Foliage, such as Maidenhair Fern, Asparagus plumosus and Sprengeri is a better supply and, prices are again normal. Guernsey flowers are still in short supply; the arrivals are very uncertain, and sometimes reach London so late they have to be held over for the next morning. In French flowers the best lines are White Ranunculus, white Stock, Allium, Anemones and Parma Violets, Mimosa is practically over for this season.

— Brazils (new). per cwt. ...	90 0–95 0	Pineapples. each	3 0– 6 0

REMARKS.—English Grapes are a gradually diminishing quantity. Bunches of the new crops are expected to arrive in Covent Garden about the middle of the present month when the earliest Peaches are due. Almeria (Spanish Grapes continue to be available. Strawberries are obtainable daily. Californian Pears consist of the varieties Easter Beurré and Winter Nelis. Supplies of English and Continental Asparagus are increasing daily. Other forced vegetables obtainable include Mushrooms, Dwarf Beans Vegetable Marrows, Potatos, Rhubarb, Seakale, Cucumbers, Peas and Tomatos. All outdoor vegetables are scarce. New season's Brazil Nuts are on offer.

ANSWERS TO CORRESPONDENTS.

A GARDENER'S NOTICE: *J. B.* The facts which you mention are too complicated for us to give advice upon without further investigation on certain points, and you had better be guided by the advice of the solicitor whom you have consulted.

COMMON BROOM SEEDS: *C. H.* The seeds of the common Broom should germinate in from 14 to 30 days, and do not require soaking or special treatment beforehand. They should be sown in Spring; if under glass, in March, and outdoors, in April. Your seeds are probably useless now, but if you place them over gentle bottom heat they would germinate within a month if they are not already dead. We have always found that the seeds of all the hardy Brooms germinate readily if sown in Spring in bottom-heat and kept fairly moist.

EMPLOYMENT AS A GARDENER: *E. N.* Seeing that you had experience in garden work before joining the army, and that you have been engaged in growing vegetables for the past eighteen months, you should have no difficulty in obtaining a post as under-gardener. Your best plan is to insert an advertisement in a gardening paper, stating your previous experience, age, and a few other particulars. A knowledge of botany is not essential, but you would find it helpful, as it would not only widen your knowledge, but would also enable you to understand some of the requirements of the plants you would be called upon to cultivate.

NAMES OF PLANTS: *W. J. M.* Phaius Norman (Sanderianus × tuberculosus). *A. W. W.* Haemanthus puniceus. *M. C.* Cornus Mas. *W. S.* Eucalyptus globulus.

POTATOS: *Interested.* If the seed tubers average 1 to 2 oz. weight, 14 cwt. is required to plant one acre. A dressing of 5 cwt. of superphosphate (30 per cent.), 2 cwt. of sulphate of ammonia, and 1 cwt. of potash per acre, forms a suitable fertiliser for Potatos and may be sprinkled on the sets when they are planted. Powdered quick lime is beneficial to all soils —even those on a chalk sub-soil; the lime should be applied in occasional seasons, at the rate of 2 tons per acre.

SUGAR FOR BEES: *W. U.* If you apply to your local county committee for sugar for feeding your bees you will be given a voucher enabling you to obtain the sugar locally, or, if you wish to procure candy, it may be obtained from Messrs. Pascalls, Ltd., confectioners, Blackfriars Road, London, S.E., on forwarding the voucher.

THE MARKET FRUIT GARDEN.

MARCH was another wild, wet month, which afforded few opportunities of overtaking arrears of land cultivation. Rain or snow fell on twenty-one days, the total fall at my station being [illegible] inches, which is not far off double the average for the month, and a great contrast to last year, when only [illegible] inches fell on eight days in March. The only thing that can be said in favour of the weather is that it was cold enough to keep fruit blossom in check. The thermometer four feet from the ground fell to freezing point or below it on fourteen occasions, the most frost being [illegible] on the [illegible]. On the night of the [illegible], there was a heavy fall of snow, which had not entirely disappeared by the close of the month, and cold north winds prevailed during the last fortnight. As a result, vegetation, which at one time looked dangerously forward, is now rather backward than otherwise. Peaches and Black Diamond and Monarch Plums have often been in bloom here soon after the middle of March, but this year not a single blossom showed white by the end of the month, though they were on the point of bursting and must open in a few days. I consider this lateness, coupled with the fact that we have had so much cold, wet weather, as being all in favour of a good set of fruit, for there should be all the more chance of favourable weather at blooming time. It is probably too much to hope that any insect pests have succumbed to the frost. Aphides might have been killed had they been about, but the search for mother green aphides on Plums, which are said to hatch out before the bloom buds open, has proved fruitless as in previous years, although the trees will doubtless be infested later. Moths can certainly stand frost, for I found a female March moth quite lively on a tree after a night when 10° of frost were registered.

CULTIVATION IN ARREARS.

The past winter was the worst in my experience for digging operation in fruit plantations. The women, who do most of this work, were not able to proceed for eleven weeks after Christmas, and did not resume work until after the middle of March, the land being too wet. A few men managed to dig at intervals during that time, but there was much of the work to be done by the end of the month. Hoeing should have started before then, but this must wait until the digging is finished. It is urgently required, for grassy weeds have grown practically all through the winter, and some of the plantations are green with them.

NO DAMAGE BY BIRDS.

There is no doubt that the bird population of the district has by no means got back to normal since its severe thinning by the hard winter of 1916. Never since then has much damage been done to fruit buds. This year there has been no trouble with birds, either amongst Plums or Gooseberries, and scarcely any bullfinches have been seen. I am not at all sure that this is a matter for congratulation. Damage to buds, and ripe fruit is very annoying, but birds are easier to fight than hosts of caterpillars, which appear to be the alternative.

TOP-GRAFTED TREES.

It is generally agreed that a free-growing variety of fruit tree should be chosen as the scion for top-grafting old or unsatisfactory trees, but success also depends very much upon the variety used as the stock. The best result I have had was with Bramley's Seedling on Irish Peach, and the worst with several varieties (including Bramley's Seedling) on Gascoyne's Scarlet. The Irish Peach trees were headed down because they did not crop very well, whilst the fruit was very scabby and did not sell freely even when healthy. The trees were not very vigorous, the stem and branches being slender, but they were practically free from canker. The re-grafting was done in [illegible], and the trees carried a light crop of very fine fruit last year, and look like bearing freely this season, for they are now fine specimens, well studded with fruit spurs. I am inclined to think that moderate vigour and freedom from canker in the stock are the most important factors for success in top-grafting. Exactly the opposite characteristics are found in Gascoyne's Scarlet, which with me makes rank growth and cankers hopelessly. There is no difficulty about the actual grafting. The scions start well, but die off as the season advances. Examination shows that the trouble is in the stock, the bark rupturing and subsequently turning brown and rotten. I have seen this result attributed to the excessive sappiness and vigour of the stock, the scion being unable to take all the sap; and I think there is truth in the theory. At any rate, there was scarcely any of this trouble in trees top-grafted last spring when one branch was left intact (not headed down for grafting) with the idea that it might utilise any excess of sap and relieve the pressure on the scions. These branches have now been sawn off, and I shall be interested to see how the trees behave this year. In pruning them, I found a great deal of canker about the stocks, and in some cases at the junction of stock and scion, particularly where the scion is Cox's Orange Pippin. Although there is often no actual canker wound, the little red perithecia of the fungus can be seen, showing that the disease has entered in the soft tissue about the junction. I am trying to prevent this from developing by brushing in a solution of sulphate of copper.

Top-grafting is an excellent way of dealing with varieties that prove unsatisfactory, because it gives a fruiting tree sooner than grubbing and replanting; but I doubt if it can be recommended where the stock is of a variety very liable to canker. The junction forms just the kind of wound through which the fungus can enter easily. In future I shall endeavour to prevent this by the use of some protective dressing. By this means, and by avoiding the heading down of all the branches in one year, perhaps more uniform success will be obtained.

CHANGE IN HABIT OF APPLES.

It is astonishing how long any variety of Apple must be grown in a certain district before it is safe to give it a thoroughly good character. A change for the worse may come after many years. Blenheim Pippin is a case in point. This variety has been grown here for the past eighteen years, and always found to be one of the healthiest sorts, being almost entirely free from canker. Only one row was planted at first, but, as these remained healthy, Blenheim Pippin was planted fairly extensively nine years later. These younger trees have grown well, and were quite sound up till last year. Now I find that they are badly cankered, on young branches as well as old, and many limbs had to be sacrificed when pruning. Last season, it must be admitted, was particularly favourable to canker attack on young wood, and it is possible that this is only a temporary lapse on the part of Blenheim Pippin; but from present appearances the trees seem to be going to the bad. James Grieve, in most places apparently a very healthy variety, has given a similar experience here. The first batch of trees introduced made an exceptionally good start and came into bearing early. On the strength of this, many more trees were planted. Now, for several years it has cankered persistently, and it is very doubtful whether the trees will ever recover. This kind of thing means much to the grower. Trees that canker badly, even if they eventually recover, absorb an enormous amount of labour; and, if they finally go entirely to the bad, several years are lost in bringing the land into profit. One of the most valuable lessons a grower can learn is which varieties will remain healthy and crop regularly on his land and this he can learn only by many years of experience in one place, unless he starts in a district where there are extensive orchards established to serve as an object lesson. If the Board of Agriculture should plant experimental orchards in many districts, largely with a view to testing the suitability of

different varieties to local conditions, great service would be done to fruit growers.

SPRING SPRAYING PROGRAMME.

Winter spraying was not finished until the middle of March, but, there will now be a welcome interval of several weeks before the machine is again brought out for the busy spring spraying campaign. This will start as soon as the bloom buds of Apples have separated out in the trusses, but before they burst and show the petals. It is safe to predict that there will be plenty of aphis, psylla and caterpillars to attack then, for these enemies are with us every spring. Soft soap and nicotine will be used for this first spraying, because, whilst it is an excellent wash for aphis, psylla and other sucking insects, it will also control caterpillars in their young stage. After the petals have fallen, it will probably be necessary to spray again for caterpillars, as these hatch out over a considerable period, and some are sure to survive the first application. On that occasion, arsenate of lead will be used, as some of the caterpillars will have grown too large to succumb to nicotine; but the latter will be added if aphis is still troublesome. For such varieties of Apples as are liable to scab, and Plums that suffered from brown rot in the past season, lime sulphur will also be added, and a second spraying with lime-sulphur given about a fortnight later, if materials hold out. Present prospects are for a good fruit crop and satisfactory prices, so that a big outlay on spraying will probably be justified, notwithstanding the very high price of materials. Not having quite enough nicotine to go with the supply of soap, I recently thought to buy a little quassia extract, which used to be very cheap, only to find that it has risen to nearly £1 per gallon. *Market Grower.*

NARCISSUS GOLDEN CYCLE.

THE name of this new Narcissus is a happy combination of portions of the parental names, as its progenitors were the popular N. Golden Spur and N. cyclamineus. N. Golden Cycle (see fig. 72) is a robust hybrid, and the flowers have such distinct characters that it is not at all difficult to name the parents from them. N. Golden Spur has given robustness and size, while N. cyclamineus has greatly influenced the form of the flower. The latter has more or less reflexed perianth segments, and a straight trumpet, with frilled mouth—characters which carry the impress of N. cyclamineus. The stems are from 12 to 15 inches high and the flowers are somewhat similar in size to those of N. Queen of Spain. For cultivation in pots for early flowering, and for moist places in the rock garden, N. Golden Cycle should prove valuable, as it possesses grace of form and a brilliant golden yellow colouring. The hybrid was shown at Westminster on March 25 by Capt. H. Hawker, Strode, Ermington, Devon.

FIG. 72.—NARCISSUS GOLDEN CYCLE: A HYBRID OF N. CYCLAMINEUS. (R.H.S. Award of Merit, March 25, 1919.)

THE CULTIVATION OF THE PEAR IN FRANCE.

The question of fruit growing is just now occupying considerable attention, and is one of the items in the programme drawn up by the authorities for men settling on the land. The subject requires serious thought, and must be handled in a businesslike and capable manner.

The technical inspectors to be appointed by the Department for the purpose of advising and organising fruit growing should have impressed upon them the fact that fruit growing is a subject that concerns not only the commercial grower, but also the general public.

We can improve the quality and greatly increase the quantity of Pears over the greater part of England, but we must be prepared to adopt some of the methods of French growers to attain these results.

There are varieties of Pear which, when worked upon the Pear stock, lend themselves to standard culture. Varieties such as Williams Bon Chrêtien, Conference, Pitmaston Duchess, and many others produce enormous crops of medium sized fruit, good enough for a second-class trade, and sufficient to meet the demands of the commercial centres where large numbers of Pears are disposed of from stalls and barrows to the industrial classes.

In suitable localities where no strong winds prevail the practice of planting fruit trees in the hedgerows might be strongly advocated, for many Pears would grow healthfully from among the lower brushwood, serving also the purpose of improving the countryside. One cannot fail to notice the foresight and tact used by our forefathers in utilising the hedgerows when gazing upon those well-grown handsome specimens of Perry Pear trees so often met with in Herefordshire and the adjoining county of Worcestershire. They stand as lasting monuments to an age of fruit growers whom the planters of to-day might profitably imitate.

Another way in which we might bring about an improvement in the cultivation of the Pear is to pay more attention to the bush or pyramid tree grown upon the Quince stock, by practising the system of French pruning. In France the ordinary garden labourers frequently possess a knowledge of pruning and training trees which we might look for in vain in this country.

The writer, being on military service during 1916, was quartered for a period in a French château near Arras, and through the kindness of the Officer Commanding had been given permission to visit the fruit garden at any time. In this very striking garden were to be seen some bush Pears worked upon the Quince stock, many of them of great size and perfect symmetry being interesting examples of good pruning. Much pleasure and valuable information was gained by daily visits to the fruit garden, also in conversing with the old gardener, whose aim and ambition was to maintain and keep those beautifully grown trees in perfect condition, till the day came when the owner of the château could return to look once again upon the fruit trees of which he was justly proud.

The system of pruning practised by this old French horticulturist at first sight impressed me as being far from correct, but after many interesting conversations bearing on the matter, coupled with the subsequent yield of magnificent fruit, I perceived that the old gardener understood the practice and principles of pruning.

There are many districts in England where situation and climatic conditions are suitable to the culture of the Pear, comparing favourably with those around Arras, for there, as in this country, the winter and spring prove without exception most trying to the fruit grower. It is a mistake to suppose that the climate of France is entirely responsible for the production of those fine fruits we have been so accustomed to see in our markets; climate one admits is a great factor, but it must not be overlooked that in France the cultivator pays thorough and constant attention to his trees, with which a life-long experience has made him familiar. There pruning is an orderly procedure and well carried out, whilst manuring and general treatment is undertaken in the same skilful manner.

A third way of improving the culture of the Pear, and one that has been to a large degree neglected, is by utilising walls for growing trees in the various forms seen in France. Private gardeners in large establishments know the value of these walls, and without them they could never obtain certain varieties of choice winter Pears. Many of the dividing walls in cottage and villa gardens, also outhouses in certain parts of the farm, might, with advantage, be used in this way to increase the fruit supply. *J. Coombes.*

DRY-WALL GARDENS.

Alpine-gardening provides great scope for the exercise of technical skill, and it also offers a ready means for pictorial display. In the construction of the rock-garden, however, one is often sensibly impressed by the scenic effort expended upon the rocks that, in numerous instances, appear placed so as to attract great attention to themselves; meagre plants hug the all but naked ridges, or project from capacious fissures, yielding sparse and patchy greenery barely sufficient to suggest the mission to which the rock-garden aspires. Between vegetation and natural rock there is always direct harmony, and when interpreted with sympathy and displayed intelligently, as seen in all good rock-gardening, the interest and attraction of such a harmony increases with the years.

This affinity between plant growth and weathered stone is excellently portrayed in dry-wall gardening, where pictorial effect is studiously aimed at, and the idea of including plants merely because they are "rare" is discountenanced; compared with the rock-garden, a successful dry-wall should convey a definite note of mildness, the floral display being suggestive of a riot of blossom, broadly planned, with the masses of colour proportionate to the extent of wall treated. This phase of gardening cannot be considered as new, for many picturesque old wall gardens, built on the dry-wall principle, are occasionally to be met with in various parts of this country, and the idea has probably been borrowed direct from Nature, as she has an inimitable way of clothing old masonry that has become neglected, with a drapery of living plants.

The arguments for introducing dry-walls into gardens are, briefly, that they occupy much less room than an elaborate rock-garden, and can often be accommodated where space is limited. Grass banks, once common in gardens, are always difficult to maintain in good order and are of no great interest; the dry-wall displaces these, adding a fresh feature to the garden while broadening its interest. Even where a rock-garden exists, the dry-wall may still be represented, surrendering to it those plants of free and vigorous growth that can readily be dispensed with on the more ornate structure, while to the rock-garden proper we entrust such plants as call for close attention to maintain them in ordinary health. The purpose of a dry-wall is best expressed by way of a retaining wall; it should act as a support to the mass of soil behind, while the latter affords a deep, moist, root run for the plants at all seasons. The work of building a dry-wall is not difficult and is well within the power of all who take pleasure in laying out and arranging their own gardens. Stone is the best material for building the wall, and if it can be procured in pieces of fairly uniform thickness the labour of bedding and adjusting the courses will be greatly lessened. A good stone should be neither too hard nor too soft; if the latter it will most likely disintegrate rapidly under the action of frost. Stone has this further advantage in that it permits of copious ledges and joints. The end of each stone embedded in the wall should be slightly lower than the exposed edge, to admit of watering the plants, if needed, in dry weather, and if each succeeding course is set back an inch or more behind the one beneath, the ledges thus formed will readily catch the rains. A wall built on the ledge system will recede sharply from the ground level, with an incline or slope that may be as much as six inches in every foot of height obtained. Dry-walls of this nature may generally be recommended for hot, dry situations. In an upright wall the incline or "batter" need only be two inches to every foot of height, and such a wall most readily meets the conditions of moist districts. Whatever type of wall is adopted, embed the stones firmly and fill all joints and vacant spaces behind them with soil, making the wall thoroughly rigid as the building proceeds. In laying the second and subsequent courses, arrange the stones, so far as is possible, to cross the joints of the lower course, while the layer of soil between the courses should be sufficient to bed the stones securely.

The soil used in dry-walls should be good loam, mixed with a liberal amount of grit and old mortar rubble or crushed chalk. It is best to arrange the plants in position as the wall is built, and in this way large plants can be introduced and their roots spread out to their fullest extent. In every case, the crown of the plant should be kept just within the face of the wall. Small, rooted cuttings and seedlings give the best results; plants that have become root-bound in pots do not become established so readily. A dry-wall may be made and planted at any time during autumn, winter or spring when the soil is in a moderately dry condition; when it is very wet or pasty the work should be suspended, as wet earth shrinks when dry, and leaves air passages that are harmful to the roots.

During their first season, the plants should be sprayed over morning and evening in dry weather with clear water. In times of drought give the soil a thorough watering through a fine sprinkler, and in such a way that the earth is not washed from the joints and courses. After the first season watering is rarely necessary, as the roots will then be firmly established,

Fig. 73.—A fine clump of Dianthus suavis growing in a dry wall.

and will usually find an abundance of moisture in the cool recesses of the wall.

The grouping and blending of the various subjects offers a wide field to those of artistic tastes. In order to obtain varied effects, both from leaf and flower, it is advisable to make, in advance, a rough plan on paper of the main groupings. This can be followed as the work of erecting the wall proceeds, and it will enable the main colour groups to be estimated correctly, and also the habit of each plant. In this way large, bushy subjects will not get mixed up with plants of smaller, finer growth that in any haphazard planting would certainly occur. The following is a list of plants suitable for a dry wall exposed to sunshine:—Acantholimons, Androsace lanuginosa, A. sarmentosa, Arenaria montana, Alyssums in variety, Asperula hirta, Armerias of all varieties, Cheiranthus Allionii, Campanulas (dwarf sorts), Calamintha alpina, Dianthus graniticus, D. microlepis, D. caesius, D. neglectus, D. suavis (see fig 73), D. plumarius, D. petraeus, D. deltoides, Draba aizoides, D. Dedeana, Erysimum pulchellum, Geum montanum, Gypsophila repens, Hypericum Coris, H. fragile, H. repens, H. reptans, Hutchinsia alpina, Iberis in variety, Iris stylosa, Linum narbonense, L. arboreum, Lithospermums (all kinds, prostratum and its variety should be planted in soil free from lime), Lychnis Viscaria splendens, Morisia hypogaea, Oenothera riparia, Onosma tauricum, Phyteuma orbiculare, Papaver alpinum, P. nudicaule, Plumbago Larpentae, Saponaria ocymoides splendens, Saxifraga Aizoon, S. Cotyledon, S. lingulata, S. longifolia, S. marginata, Sedum brevifolium, S. dasyphyllum, S. rupestre, S. spurium, S. pulchellum, Sempervivums in variety, Silene alpestris, S. Schafta, Thymus Serpyllum in variety, Tunica Saxifraga and its double form, Veronica Bidwillii, V. incana, V. rupestris, Viola gracilis and Zauschneria californica.

Plants for dry walls in the shade:—Adonis vernalis, Anemone narcissiflora, A. blanda, A. angulosa, A. Hepatica, Arenaria balearica, A. caespitosa, Asarum europaeum, Cardamime trifolia, Campanula carpatica, C. muralis, C. pusilla, Cyclamens in variety, Dicentra formosa, Epimediums, Erinus alpinus, Haberlea rhodopensis, Mazus pumilio, Myosotis in variety, Mentha Requienii, Nierembergia rivularis, Omphalodes verna, Oxalis enneaphylla, Polygala Chamaebuxus purpurea, Primula farinosa, P. frondosa, P. cashmiriana, P. latifolia, P. nivalis, P. rosea, Ramondias in variety, and Saxifragas (all mossy kinds).

Shrubby plants for sunny dry walls:—Cistus in variety, Helianthemums, Lavender, Cytisus kewensis (see fig. 75), C. schipkaensis, C. Beanii, Cydonia Simonii, Cotoneaster adpressa, C. congesta, and C. rupestris. *Thos. Smith.*

VEGETABLES.

POTATOS.

In gardens where the soil is rich or is overladen with humus owing to many years of manuring, Potatos of many varieties are liable to grow too rank, and by August the hauln falls down, one line overlapping another. Some varieties seem to be naturally of this habit, including The Schoolmaster and Snowball, the hauln of which is upright at first, but as the season advances it falls down. Kerr's Pink grew over 2½ft. high last year with me and elsewhere, yet the stout stems stood perfectly upright to the last, both during drought and the heavy rains that followed. Golden Wonder and The Templar were similar in habit and, notwithstanding their height and vigour, did not fall down and smother dwarfer sorts growing on each side of them. Kerr's Pink gave me the heaviest crop of any, and I calculated it at 29 tons, 19 cwt., 67 lbs. to the acre. It is also blight-resisting and immune to wart disease. The number of excellent varieties of Potatos now determined to be immune to wart disease is considerable, as *R. P. B.* states on p. 108; but in looking over the lists of non-immune varieties I find that some 28 varieties of the Up-to-Date type would have to drop out of cultivation, including such high quality and heavy cropping sorts as Up-to-Date, Duchess of Cornwall, Dobbie's Prolific, Stourbridge Glory, Superlative, The Factor, The Chapman, and The Warrior. Amongst others, we cannot overlook the popularity of British Queen, Sharpe's Express, Epicure, Arran Chief, Tremendous, Duke of York, Goldfinder, Sir John Llewelyn, King Edward and many others, which have their numerous adherents. Early varieties that are immune are still few. The most popular variety is Edzell Blue, which is not a success in all soils. It was the only real failure amongst 18 varieties I grew last year in a shallow, sandy soil. Even if seed of immune varieties were procured from an infected district, it would carry the disease amongst soil on the tubers, but I understand this is now being controlled. The crux of the question lies in the fact that hundreds of people prefer or adhere to certain varieties because they succeed well in their soil and they like the particular qualities of those varieties. The danger of importing wart disease to their gardens or fields has not yet been brought home to a great many people. In Aberdeenshire the practice of cutting all seed Potatos is very general; but uncut sets are also used on large farms where they save time in cutting, which is generally done by women. The clamps are simply laid open when planting is about to commence, and the tubers taken as they come, the large ones being cut. No lime has ever been used to my knowledge for cut or uncut sets. *J. F.*

FORESTRY.

THE SITKA SPRUCE

AMONGST the exotic trees that are likely to secure a prominent position in any scheme of forestry operations that may be undertaken in the British Isles, the Sitka or Tideland Spruce (Picea sitchensis) will be one of the most important, as it produces timber of good quality, gives excellent results in many parts of the country, and is suitable for planting at sea-level in the mildest places, and in exposed situations at a considerable elevation in the Scottish Highlands, where the soil is poor, cold and wet.

Inhabiting an extensive area of land in Western North America, the Sitka Spruce is found from a northerly point in Alaska to Mendocino County in California, being most common in Western Oregon and Washington, where in rich, moist soil it attains its largest size, *i.e.*, 200 feet high, with a diameter of 15 or 16 feet. Its average height is about 100 feet, and in some places it occurs as pure forests on swampy ground about the mouths of rivers, little, if at all, above high-water mark; elsewhere it may be pure or mixed with other trees such as Douglas Fir, species of Abies, Thuya plicata and other kinds. In its most northerly limits it is reduced to a bush.

This species may be distinguished amongst other Spruces by its stiff, flat, needle-pointed leaves, which vary from ½ inch to 1¼ inch in length, and are green above and glaucous beneath. They surround the branches, but are denser on the upper than on the lower surface. The mature cones are bright brown, cylindrical, 2½ inches to 4 inches long, with rather prominent scales with an undulated or toothed margin to the upper parts. The seeds are small with a rather long wing.

From a timber point of view the wood is light, soft and strong, usually straight-grained, compact, and often yellowish in colour, with a satiny lustre when worked. It has been used for many years for general carpentry, including house-building, fencing and boat-building, and also for pulpwood. Soon after the outbreak of war attention was directed to this wood as suitable for aeroplanes, and for the last three or four years it has been one of the most eagerly sought after woods for the purpose, all the best quality wood being ear-marked for the business. Manufacturers in this country usually refer to it as Silver Spruce.

The tree was originally discovered by Menzies in 1792, but it was left for Douglas to send the first fertile seeds home in 1831. Its value for decorative planting was soon appreciated, and some of the earlier trees are now over 100 feet high, with a diameter of 2 to 3 feet. A few years ago I measured a tree growing at Achnacarry which was known to have been planted in 1865; it was 98 feet high and had a girth of 8 feet 8 inches at 5 feet above the ground. Near by, a Douglas Fir planted at the same time was the same height but rather larger in girth. The best plantations in Great Britain are probably at Durris, in Kincardineshire. There are two in which the trees are now about 40 years old. One is at an elevation of 700 feet and the other at 900 feet above sea level. In both cases the land is poor, wet and exposed; in fact, in one plantation there is a considerable depth of peat, and in order to remove the superfluous moisture it was necessary to open deep drains at frequent intervals. The trees are, however, in perfect health and growing rapidly.

On the western side of Scotland experiments are being carried out under the worst possible conditions with this and a few other trees. At Corrour, on the banks of Loch Ossian, at an elevation of 1,269 feet above sea level, Sir John Stirling Maxwell is experimenting with this tree in very poor, wet and sour peaty soil, in a district where the growing season is short, severe frosts being frequent in May and October, and frosts often occur in the summer months also; moreover, heavy winter snows and biting winds are common. Every attempt to establish trees by ordinary methods of planting failed, but on adopting the plan of opening drains at frequent intervals and planting trees on raised turves several species are growing well, one of the most satisfactory being the Sitka Spruce, the young trees adding from 12 to 18 inches to their height each year.

As a contrast to these conditions Sitka Spruce has been planted on light land composed largely of disintegrated granite in the neighbourhood of Penzance, and the young trees, when about six years old, added rather more than 5 feet to their height in a single season. Later on these particular trees were injured by wind, many of them having their tops broken. The fault apparently lay in the plantation being too narrow to act as a good wind-break. Elsewhere the tree has been noted growing well near the sea, where the plantations are deep enough for the centre trees to profit by the shelter afforded by the outer belts. It is extremely doubtful, however, whether such rapid growth as that mentioned above is an advantage, for the timber from such trees is usually weaker than that of normal growth.

The Sitka Spruce is liable to attacks from the Spruce-gall Aphis (Chermes abietis), especially when growing in unsatisfactory conditions such as a very dry soil or dry or impure atmosphere. On small trees it is possible to destroy this pest by spraying the branches once every twelve days during May and early June with a paraffin wash, but it is more satisfactory to avoid attacks by only planting the tree where the atmosphere is fairly free from impurities and the climatic and soil conditions are moist.

When planting under forest conditions the young plants should be placed in permanent places when from 9 to 15 inches high. *W. D.*

FIG. 74.—AUBRIETIA, HELIANTHEMUM, SAPONARIA AND OTHER PLANTS GROWING ON A DRY WALL. (*See p.* 175.)

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM HUMEANUM AND O. ASPERSUM.

Mr. J. O'Brien (page 136) remarks that my statement of the parentage of Odontoglossum Humeanum is based only on conjecture. This is not so. It was based on an examination of all the facts available, including flowers from two different plants sent to Kew by Mr. O'Brien himself in April, 1889, with the name O. Humeanum (carefully recorded in inverted commas at the time), and two more received from him three years later. Those flowers agree with the seedling raised artificially from O. maculatum × O. Rossii, as also do others recently attributed to O. Humeanum. There has never been any doubt about the parentage of O. aspersum, which was as clearly stated in Reichenbach's original note as in my own recent one, which therefore "tends to confuse" nothing. It is no new idea that the recorded parentage of O. Humeanum is erroneous. When the plant was figured in *Reichenbachia*, soon after Reichenbach's death (ser. i. t. 82), it was remarked by Messrs. Sanders, "O. Humeanum is universally considered to be a natural hybrid between O. Rossii and O. cordatum, but a comparison of the shape and structure of the flower leads us to think that there is less of O. cordatum and more of O. maculatum in it, the characters of the latter being also observable in habit of growth." The fact is, only one (rather variable) natural hybrid is known, which is found where O. Rossii and O. maculatum grow together, this hybrid combining the characters of the two species from which it has now been raised artificially. O. cordatum is not known to grow wild with O. Rossii, and the rather scanty evidence on the subject indicates both a lower elevation and a station further south. *R. A. Rolfe.*

THE BULB GARDEN.

GALANTHUS IMPERATI.

IN my note on page 107 I expressed a doubt as to whether the plant that is known in gardens as Galanthus Imperati has any real claim to that name. Since writing that note I have had an opportunity of looking up some of the literature on the subject, and, as frequently happens in dealing with garden plants, I have come so the conclusion that the claim of the plant illustrated to the name of Imperati is by no means beyond question.

G. Imperati was first described by Bertoloni in his *Flora Italica*, vol. iv., p. 5, which was published about 1833. Bertoloni refers to Clusius' *Rariorum Plantarum Historia*, which was published at Antwerp in 1601. At first sight it would appear as though Bertoloni identified his Italian Snowdrop from the neighbourhood of Naples with the bulb that Clusius describes and figures on page 169 as Leucoium bulbosum praecox Byzantinum, but a careful perusal of the accompanying text shows that Clusius knew two Snowdrops besides nivalis, one of which "began to arrive at Vienna from Byzantium (Constantinople), mixed with Narcissus bulbs, after the year 1582," while the other, which was "almost identical," was sent to him by Imperatus, an Italian pharmacist, from Naples in the autumn

of 1592, as having been dug up on Mons Virgineus. If anyone can identify this Mons Virgineus, on which Imperatus dug up the bulbs he sent to Clusius, we may be able to obtain authentic specimens of the real Galanthus Imperati.

With his usual accuracy in describing the actual flower, which shows that he was intimately acquainted with the living plant, Clusius draws attention to the fact that the inside of the inner segments of his second Galanthus (the first being nivalis) was either largely blotched with green or marked with eight longitudinal veins of green running from the base to the tip.* Now these eight veins on each inner segment are a characteristic of the Crimean G. plicatus, which has broad foliage with a longitudinally folded edge from which it obtains its name.† and Clusius' woodcut certainly represents a plant with remarkably broad leaves. His figure also has two stems of unequal length, and it would be interesting to know whether this is also a characteristic of G. plicatus. It is unfortunately too late now to discover this year whether my so-called Imperati has eight veins on its inner segments or only the six of nivalis, but it certainly differs in more ways than one from Bertoloni's plant as he describes it. We must obviously suppose him to mean by the latter not Clusius' Byzantine plant, but that other that was sent to him by Imperatus, which he did not describe.

Bertoloni insists that Imperati differs from nivalis in having a globose bulb twice as large as that of nivalis and a larger spathe, which is much longer than the peduncle supporting the flowers. He also lays stress on two further points of difference. Firstly, the outer segments of the flower of Imperati, instead of being twice, or more than twice, as long as the inner segments, as they are in G. nivalis, are only about one-third longer; and, secondly, Imperati flowers later than nivalis.

Now, the plant which was illustrated on page 106 has not got the comparatively long inner segments of the true Imperati, and it certainly flowers earlier, and not later, than nivalis. Although its flowers are no larger than those of some G. nivalis—which Sir Herbert Maxwell very kindly sent me from Monreith for comparison—they are certainly nearly twice the size attained by those of nivalis in this dry soil. Its identity is, therefore, uncertain, and I shall be very grateful to anyone who can throw any light upon it. It is, without doubt, a fine Snowdrop, even in the poor, light soil of my garden, and it is certainly valuable for its early-flowering habits. *W. R. Dykes.*

* Interius vero aut magna ex parte viridia sunt aut octo radiis ab imis unguibus secundum longitudinem ductis prædita.

† Marschall von Bieberstein. *Flora Taurico-Caucasica.* III. p. 255 (1819). G. plicatus differt a nivale foliis latioribus utrinque prope marginem plica longitudinali insigni instructis.

WARM HOUSE RHODODENDRONS.

THE plant lover has many reasons to regret the dispersal of Messrs. James Veitch and Sons' collections of plants, as many of them are now scattered, and no one seems to have taken up their special cultivation. Among them are the various forms of warm-house Rhododendrons, to which the titles of Javanese, Malayan, and Perpetual-flowering have at various times been applied. The different garden varieties have resulted from the crossing and inter-crossing of some half a dozen species and their progeny. The original species are all natives of different islands of the Malayan Archipelago, and occur there principally as epiphytes, finding a rooting medium in the vegetable débris collected in the forks of tree branches and other places.

Practically all the garden varieties in cultivation originated with Messrs. Veitch, the first to make its appearance being Princess Royal, obtained by crossing the orange coloured R. javanicum with the white R. jasminiflorum. Strange as it might appear, the flowers of the hybrid were pink, the orange tint being totally eliminated. A parallel case may, however, be found in Begonia weltoniensis, raised 50 years or so ago by the late Colonel Trevor Clarke, of Daventry. The parents of this were the coppery orange Begonia Sutherlandii and the pure white B. Dregei, both natives of South Africa. As in the case of the Rhododendron, the flowers of B. weltoniensis are pink.

After the advent of Rhododendron Princess Royal new varieties were continually put into commerce, with flowers varying from white to deep crimson, through various intermediate shades of yellow, orange, pink, and carmine. Many of the more recent varieties were great improvements on the older ones, which they in time superseded. A notable feature of these Rhododendrons is that, unlike the other members of the genus, they grow and flower all the year round. From this circumstance their name of Perpetual-flowering is derived. At whatever season one visited the nursery at Chelsea the house devoted to these Rhododendrons was sure to be well supplied with blossoms.

Despite their many desirable qualities there is no doubt that within recent years these Rhododendrons have declined in popularity. This is probably owing to the circumstance that however beautiful they may be when on the plant the flowers are not well adapted for decorative purposes as cut blooms, hence they have been superseded by such subjects as the Perpetual-flowering Carnations. This is a pity, as they cannot well be spared where flowers are always in demand.

The original species from whence these garden Rhododendrons have sprung are all natives of tropical regions, hence all the forms of this section require more heat than the Himalayan hybrids. They are sometimes called greenhouse Rhododendrons, but this is a decidedly misleading term, as for their successful culture they require a minimum winter temperature of about 55°.

Cuttings of the half-ripened shoots will, if dibbled into pots of sandy peat and placed in a close propagating case in a warm structure, soon make roots. I find that roots are produced more freely from the base of the young shoot, where it is somewhat swollen, than from any other part. If the shoot is too long to be used in its entirety (say over 3 inches), the base of the cutting is best finished off with a long, sloping cut.

A suitable compost for these Rhododendrons consists of fibrous peat with a liberal admixture of silver sand. In potting them their epiphytal character should be borne in mind; if the roots are surrounded by a dense mass of soil success cannot be hoped for. The pots should not be too large. They should be clean and effectually drained, for these Rhododendrons need liberal supplies of water during warm weather, while frequent syringing is very beneficial. For large specimens mix charcoal with the potting compost. *W. T.*

NOTICES OF BOOKS.

HOOKER'S ICONES PLANTARUM.

THE Bentham Trustees have issued from Kew a complete index to the plates and names of plants figured in the thirty volumes of this comparatively little-known publication, the first volume of which, dedicated to Bentham, is dated 1837. This illustrated work was founded by Sir William Jackson Hooker while he was still Professor of Botany at Glasgow. In this undertaking he was assisted by his friend, George Bentham, who, on Sir William being appointed the first Director of Kew on its becoming a public institution, associated himself with Sir William in founding the Kew Herbarium and Botanical Library. Bentham also provided for the continuation of the *Icones* and botanical work generally by a legacy. From the first the parts of this work were issued at very irregular intervals, with several breaks of sometimes a number of years. The full title, of the later volumes at least, is *Hooker's Icones Plantarum, or Figures, with descriptive characters and remarks, of new and rare plants selected from the Kew Herbarium.* Taken as a whole, the figures are of a miscellaneous character, yet interesting in a high degree to the botanist and horticulturist of botanical taste. The earliest volumes illustrate selections from the collections of the Drummonds, Douglas, and other noted botanical travellers, and also include mosses and other of the lower cryptogams. Several volumes are restricted to one family, at least three are devoted to Ferns, three to Orchids, mainly to such as are termed of botanical interest only, and volumes XXIX and XXX illustrate species of Impatiens representing Sir Joseph Hooker's last contributions to botanical science. Prominent among the subjects figured in late volumes are several of the novelties of relatively recent discovery in Central and Western China, many of them of general interest and represented in British gardens. Plants of economic value have also found a place in the Icones: thus, Sapium of many species, Hevea and other rubber plants. This index will be very welcome, and will open up a source of illustrative botany hitherto almost closed to workers. Each volume contains one hundred plates. *W. B. H.*

LETTERS FROM SOLDIER GARDENERS.

THE BOTANIC GARDEN AT BONN.

HAVING read with great interest several articles which have appeared from time to time in your valuable paper (of which I have been a reader for ten years) on horticulture in the various countries in which members of our armies have found themselves, I thought your readers might be interested in a short description of the Botanical Gardens at Bonn, on the Rhine, in which city, as one of the Army of Occupation, I was stationed for two months, viz., December-January. The garden is managed by the University for their students in botany and allied subjects, and is not open to the public. Although not so large in extent or so impressive as the Botanic Gardens, Brussels, which I also visited, the gardens at Bonn are nevertheless very complete.

The palm house contains several varieties of the Date Palm, all of which were in bloom, but not much more of interest.

The Cacti, exotic and temperate houses consist of one lean-to building, about 200 feet long, divided into four compartments by glass partitions.

The collection of Cacti, consisting of more than 300 varieties and species was very interesting.

The two Orchid houses were well stocked with healthy plants, but there were very few in bloom, a large white Brasso-Cattleya being the only one of note.

In the propagating house several hundred seeds of Victoria Regia were germinating.

All the available space out-of-doors was taken up by beds devoted to drug-yielding plants, and the cultivation of these plants was, no doubt, the most important work being done there; I found, in talking with the men engaged on the work that, without exception, they had all been released from the army for that especial purpose, and I have no doubt that the results of their experiments would make very interesting reading to English readers, as I see there has been much correspondence in your columns lately about growing drug-yielding plants at home. The two climates are fairly similar, and I see no reason why drug plants should not be cultivated successfully in Great Britain.

The garden authorities were also carrying out experiments with Mistleto on different varieties of Quercus, raising the Oaks from acorns for the purpose.

The arboretum contains nearly every tree grown in the temperate zone that is not a native of the country. There are notable specimens of Picea Douglasii, Cedar of Lebanon, and Fagus purpurea, also a very interesting specimen of Ginkgo biloba, about 20 feet high and divided about six feet from the ground by a crotch; one half of the tree is male, the other female, the latter half being weighted down with fruit. My conductor stated that the monoecious character was entirely natural and not the result of either budding or grafting, and I failed to see any indications of either. *Corporal J. Platts, late Horticultural Experimental Sta., Canada.*

FRENCH *versus* ENGLISH GARDENING.

Many with whom I have come in contact have expressed their admiration for the close cropping done in French small gardens; but usually that applies only to the summer, when there are many salads, Beans, and similar small crops grown. These give an air and idea of abundance which I have never seen in the winter. Then the French gardens are bare, except for Leeks, which are grown in great quantities in every garden. Seldom have I seen such winter vegetables as Brussels Sprouts, Kale, or Broccoli; and never once have I seen the Sprouting Broccoli or a bed of spring Cabbages. In the provision of fresh vegetables for winter the French gardens are certainly far behind those of our country.

In the summer we find large patches of Haricot Beans, to the almost entire exclusion of other forms. Runner Beans are seldom grown, and Peas are usually limited to the dwarf varieties. I was surprised to find so few Cauliflowers grown, and remember on one occasion in early September finding that a Cauliflower in a shop cost a franc and a-half—and this was in a district where there were many houses with fair-sized plots attached.

Nor can I say that the garden produce equalled in quality that to be found in similar gardens in England. At no time did I see any vegetables to equal those shown at any English village show.

The larger gardens give one the same feeling of inferiority when compared with gardens at home, but it must be said that they are more generally used for food production. Flower gardening is secondary, as it should be here in England for some time to come. One missed, also, the flowers in rural gardens, to which we are accustomed in England.

I repeat again that my remarks only apply to my own personal and limited observation, and I cannot be sure that I am right in drawing general conclusions from them. *W. F. Rowles.*

(*See p.* 175.)

The Week's Work.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Cyclamen.—As Cyclamens pass out of flower those required for flowering another season should be placed in a cold frame and kept rather dry for some weeks. The corms may then be shaken from the soil, repotted in a compost of loam, peat, leaf-mould and sharp sand and placed in a moderately warm, moist house until well rooted, when they can be removed to cooler quarters. Now is a suitable time to sow seeds of Cyclamen.

Begonia Gloire de Lorraine and B. Gloire de Sceaux.—For success in raising Begonia Gloire de Lorraine and B. Gloire de Sceaux it is essential the stock plants be kept free from Begonia mite. Dip the plants in a safe insecticide such as quassia, place them in a moist, warm house, and when the new growths are 2 inches to 3 inches long, cut them off and insert them in well-drained pans or pots filled with loam mixed with leaf-mould and sand. Place the pots or pans of cuttings on a stage near the roof glass as the shoots will root more successfully there than in a close propagating case. Shade the cuttings from bright light.

Tuberous-rooted Begonias.—For greenhouse or conservatory decoration the tuberous Begonias started some time ago in boxes should now be potted singly in 6-inch or 7-inch pots. Pot firmly and keep the crown of each tuber above the soil. A mixture of good loam, leaf-mould, sharp sand, and concentrated fertiliser forms a good potting compost. Seedlings of this year's sowing should be grown in a warm house and be potted singly when large enough.

Euphorbia jacquiniæflora and E. pulcherrima.—Stock plants of Euphorbias and Poinsettias that have been kept dry for some time should now be placed in a warm house, syringed daily, and kept well watered at the roots. In these conditions they soon produce new growths, and when these are 3 inches to 4 inches long, remove them with a heel of the old wood, insert them singly in small pots filled with equal parts of fine soil and sand, and place them in a propagating frame over bottom heat. When sufficiently rooted, shift them into 4-inch pots in a mixture of loam, leaf-mould and sand, and grow them on a shelf in a warm house until finally potting them into 6-inch pots.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. Sir G. L. HOLFORD, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Seasonable Remarks.—Most Orchids show by their activity that they appreciate the increase of sunlight, and this should be allowed to reach them as freely as possible so long as risk of injury to the foliage is prevented. Foliage is more susceptible to injury at this season than in the summer or autumn, and if the leaves of some Orchids become scorched they carry the marks for years. Scorching most often occurs when the air is clear and cold and one fears to give much ventilation because of cold draughts. At such times the sun may appear for a short period after it has been hidden an hour or so behind light clouds, and through the day there may be alternations of bright sunshine and shade. It is at these times the cultivator must be watchful and rather err on the side of too much rather than too little shade. During times of dry scorching winds ventilating demands great attention, and constant watch must be exercised, because when the sun shines brightly the temperature in the houses rises rapidly, even with the blinds down; on the contrary, when the weather is dull the temperature falls even more rapidly. The paths and benches should be frequently damped, for the wind dries up the moisture quickly. In dry conditions yellow thrips

will breed fast, and, if left unchecked, they not only make the foliage unsightly, but the injury they cause to the young growth has a very injurious effect upon the strength of the plant, as growth so damaged in its young state does not retain its vitality for the proper length of time. With Orchids, as with all other plants, any premature loss of leaf has a weakening effect proportionate to the extent of the injury.

Bifrenaria Harrisoniae.—This very old and beautiful Orchid is a free-blooming and easily grown plant. The flowers last long in full beauty and give a most delicious perfume. Equal parts of peat and loam fibre, a little chopped Sphagnum-moss, with crushed crocks and charcoal make a suitable compost for the plant, and this should be used in a rough and open condition, as the roots are large and easily injured if the material is too close. Good drainage is required, as a considerable amount of water is needed during the growing season. This species is best grown in a shady position at the cooler end of the Cattleya house, and succeeds best in pans suspended near the roof glass. Atmospheric moisture must be ample, or the foliage soon becomes over-run with insects; and the syringe may be used freely about the plants in summer. If any plants are in need of fresh rooting material they should receive attention soon after the flowers are over, and before they commence growing again.

Temperature.—The temperature in the various compartments may now be allowed to rise a little above the figures given in January. On bright days a rise in the warmer divisions of 10° to 15° will prove beneficial to the plants, provided the fires are kept in check as much as the weather will allow. If any attempt be made to keep up a high temperature on dull days by means of fire heat, weakness in growths and foliage will result.

FRUITS UNDER GLASS.

By W. MESSENGER, Gardener to Major J. A. BERNERS, Woolverstone Park Gardens, Ipswich.

Figs in Borders.—Fig trees which were started in the early part of January will now be making vigorous growth. Thin out the weakest shoots, and at the same time reduce the number of fruits on over-burdened trees. Stop the remaining shoots at the fifth or sixth leaf in order to assist them to develop a good second crop. Admit a little air in the early morning on sunny days, increasing the amount of ventilation as the sun gains power. Close the house early to conserve the sun heat, syringe the trees and damp their surroundings. Trees which are heavily cropped and have their borders well filled with roots will require, apart from manurial mulchings, liberal supplies of liquid manure, and occasional top-dressings of artificial compounds.

Tomatos.—Tomato plants from the earlier sowings will require constant attention. Secure the stems to the stakes or trellis, as the case may be, remove all lateral growth and pollinate the flowers by means of a soft, feather brush. When the plants have produced seven or eight trusses of flowers, pinch out the point of the leading growth in order to divert the whole energy of the plant into fruit production. Plants which have set one or more trusses of fruit will be benefited by frequent applications of weak liquid manure or soot water, with an occasional application of a suitable artificial manure. Air should be admitted freely whenever the weather is favourable, and a somewhat dry atmosphere should be maintained, more particularly during the flowering period.

Peaches and Nectarines.—It will be inadvisable to attempt undue forcing by means of fire heat until the fruits of Peaches and Nectarines have completed their stoning process, then growth may be hastened with comparative safety. The trees should have a thorough syringing at least once a day when the weather is favourable. When the stoning period is past the fruits should be fully exposed to sunshine, but it is not a good plan to tuck the leaves behind trellis-work fixed close to a wall, as red spider finds good harbourage on leaves so placed. During the stoning period, trees carrying heavy crops are subjected to a severe strain and should receive liberal treatment; the borders must not be allowed to approach a condition of drought, and stimulants should be given at each watering. An occasional light dressing of soot forms an excellent stimulant to the roots and at the same time gives off a certain amount of ammonia, which tends to ward off the attacks of pests. A mulching of half-decayed manure over the root area will preserve the moisture in the soil and attract the roots to the surface. Admit air early in the morning and gradually increase the amount of ventilation as required. Maintain a day temperature of 70° to 75° with sun heat, allowing a night temperature of about 60°, slightly more or less, according to the weather.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet, Hertfordshire.

Edging Plants.—Cerastium tomentosum and other hardy plants may be planted at once for edgings round the flower beds. These will serve to reduce the number of tender subjects needed to fill the beds, and will give a good effect during the summer months.

Herbaceous Lobelia.—The herbaceous Lobelias are fine border plants and, when planted in masses, they make a brilliant display during the summer and autumn months. L. cardinalis and its variety Victoria that have been wintered in frames may be divided, planted a few inches apart in shallow boxes filled with rich soil and grown for some time in a warm greenhouse. The stock may also be increased from seeds sown at once in gentle heat.

Hollyhock.—Young Hollyhock plants raised from seeds sown this spring should be kept growing sturdily. Transfer them to larger pots as soon as they require more root room. Plants raised from cuttings, or from seeds sown last autumn, may now be planted where they are required to bloom. The soil should be deeply dug and well enriched with decayed manure.

Vases.—In most gardens numbers of vases have to be filled with subjects that will produce a good effect during the summer time. Tastes differ, and some people prefer a blaze of one colour in each vase; others prefer mixed colours such as Fuchsias, Heliotropes, Pelargoniums, Petunias, Marguerites and Lobelias provide, but whatever style is adopted the plants should be hastened under glass and in the meantime the vases should be well cleaned out and filled with a sweet, rich compost.

Flower Beds and Borders.—Beds and plots that have not been occupied by plants for some time past should be manured and dug deeply in readiness for their summer occupants. The work should be taken in hand as soon as possible in order that the soil may have settled to its former level by planting time.

Lawn and Paths.—Roll lawns in favourable weather, and cut the edges with a keen-edged turf knife. Have paths and drives thoroughly cleared of weeds and well rolled.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Fig Trees.—Fig trees may now be planted from pots; they will succeed in any light garden soil provided it is well drained. The best position in the garden should be allotted to Fig trees: many of the failures are caused by choosing unsuitable sites. Fig trees planted in the open should have their root space restricted or they will grow excessively and fruit poorly. The roots may be confined in chambers of brickwork or concrete, 4 feet wide and 2 feet deep, with the natural soil at the bottom. These chambers should be filled with good loam to which plenty of mortar rubble and roadside scrapings are added; the whole being made firm. Cultivated in such restricted rooting spaces, the trees make short-jointed growth and produce fruit freely. If this method were practised generally there would be fewer barren Fig trees. After turning the plants out of the pots the roots should be disentangled, and all suckers removed, as well as all buds which are below the ground level. Spread the roots evenly, work the soil amongst them, and make it firm, taking care not to plant too deeply. The uppermost roots should not be more than 2 inches deep. If the weather is dry, give a thorough watering. Against a garden wall the trees should be planted 12 feet apart.

Training.—Fig trees should be trained at the base to a single stem. A fan-trained tree is the best for walls. A good central growth should be trained upright and the best-placed shoots on each side retained, leaving a space of 1 foot between each branch.

Established Figs.—Where protecting material was placed around old Fig trees it should be removed and the trees pruned, but the knife should be used only to thin out the wood where it is overcrowded, and to remove any exhausted growth. Where there is plenty of room for extension the leading shoots should not be cut. The Fig tree produces its first crop of fruits on the previous year's wood: it is therefore necessary to save as much of this as possible.

Mulching.—A good dressing of farmyard manure should be placed over the root area, as the dung supplies food and checks evaporation. Where red spider or mealy bug are present the Fig trees should be syringed with a mixture of soft soap and paraffin, at the rate of 2 ounces of soap and half a wineglass of paraffin to a gallon of water, but if trees are syringed with clear water night and morning from the end of April onwards they are seldom troubled with insect pests.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS, Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Asparagus.—The main crop beds will need attention, after the recent heavy rains and snow. To promote warmth the beds should be raked down and the surface carefully pricked over with a fork to allow sun-heat to penetrate the soil. Follow this with a dressing of soot or wood-ash. A quick-acting artificial manure will also be very beneficial. Sow Asparagus seeds on a warm border, in shallow drills drawn 1 foot apart, to raise plants for making new beds twelve months hence.

Maincrop Potato.—From the middle of April onwards, whenever weather permits, maincrop Potatos should be planted. If the plots have been treated as already advised, and the surface harrowed, there need be little delay. The sets should be well sprouted by this time, and carrying two or three sturdy shoots. Draw drills five inches in depth, and place the tubers in them from 15 to 20 inches apart, according to variety. Cover the tubers carefully with the finer soil, and do not damage the young shoots. The distance between the lines will vary from 2 ft. to 3 ft., as extremes, while 2 ft. 6 ins. will be a good average. For the purpose of producing exhibition specimens, take out a trench six inches in depth, and fill it with a mixture of three parts loam, two parts clay soil and one part finely-sifted burnt garden refuse; place the sets as previously advised, and finish planting by drawing the surrounding soil over the prepared compost.

Seakale.—The thong-cuttings of Seakale, if properly hardened off, may be planted in their permanent quarters. Choose well-prepared ground and plant the roots one foot apart in rows 18 inches wide. Dibble the cuttings in firmly, and scatter fine cinder ashes round the crowns to prevent trouble from slugs. If lime is lacking in the soil, apply a light dressing of this material.

Parsley.—The early batch of Parsley raised in boxes will now be ready for planting on strong ground that has been well manured. Apply a dressing of soot, rake the surface soil fine, and plant the Parsley in rows, one foot apart. Remove the plants carefully, each with a ball of earth on the roots, and, if necessary, give water after planting. Afterwards use the hoe freely to promote quick growth, and give the crop an occasional dusting of soot overhead.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the **PUBLISHER, 41, Wellington Street, Covent Garden, W.C.**

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, APRIL 14—
United Hort. Ben. and Prov. Soc. Com. meet. Bath Gard. Soc. meet.

THURSDAY, APRIL 17—
Manchester and North of England Orchid Society meet.

FRIDAY, APRIL 18—
Good Friday.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 47.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, April 9, 10 a.m.: Bar. 29.75; temp., 50°. Weather—Fine.

Cultivation and Fertility. It is a very generally held opinion that high cultivation results in decreased fertility, and the well-known fact of the seedlessness of certain cultivated fruits, such as Bananas and Grapes, is pointed to in support of this opinion. Such cultivators as Darwin and Lindley have lent their support to this view, the former author stating that "when the seeds in our fruits become atrophied, the fruit itself grows largely in size and quality."

Nevertheless, in spite of the prevalence of this opinion, there is no very great weight of evidence in its support. It is easy to see that the examples of seedless fruits are not necessarily examples of loss of fertility in consequence of increased size. If from any other cause a variety valuable in itself become seedless, it would no doubt be perpetuated by artificial means and come in time to be regarded as an example of a fruit which owed its size to its seedlessness.

With the object of ascertaining by observation what truth is in the commonly accepted view that lessened fertility is associated with hypertrophy of fruits, Mr. C. S. Crandall* has made comparisons between the number of seeds in different cultivated varieties of Apple and in various wild species of Crab.

To this end he removed and counted the seeds in some 28,000 Apples and in upwards of 6,000 fruits of 25 species and varieties of the genus Malus.

The Apples were divided into two groups large-sized and small-sized fruits. The enumeration of the seeds leads to the conclusion that cultivated Apples develop seeds in greater numbers than do wild Crabs, and, further, that the number of seeds in large-sized Apples is greater than it is in fruits of smaller size.

Thus the average number of seeds in the fruit of 12,912 Apples of large size (32 varieties) was found to be 8.27, the average in 8,500 Apples of small size, 7.21, and the average in 6,642 fruits of Crab Apples was 4.22. Needless to say, there is among cultivated Apples a large variation in the number of seeds, ranging from 4.09 seeds in a fruit of the variety Collins to 15.04 in Shockley.

Among Apples which may be seedless, the author enumerates McMahon, Twenty Ounce, Collins, Wealthy, Jonathan, and several others. Seedless fruits were found to occur more frequently in small than in large fruits. Hence, so far at all events as the Apple is concerned, the commonly held view that decreased fertility is associated with increased size of fruit is erroneous; and seedlessness would appear to be a contretemps which arose independently of increase of size, and once having arisen it was perpetuated by artificial means.

* *Seed Production in Apples.* By C. S. Crandall. Bull. 203, Univ. of Illinois Agric. Exp. Station, 1917.

Sir William Crookes, O.M. It matters not how much scientific knowledge may be piled on scientific knowledge, nor how the accumulated mass of scientific facts may weigh upon and oppress the minds of ordinary scientific workers—vexing them with the worry of finding out where to fit themselves into the ranks of the army of discoverers, and so aid in the ordered advance of the line in which they are units—there will always be, at all events among British men of science, pioneers. Pioneering is in the blood of the race; it is part of its intellectual equipment. Ineradicable amateurishness, shocking to the trained conventionalised mind; naïveté, which to the merely clever seems only puerility, but which is the chrysalis out of which genius may take its flight; above all an instinctive ensuing of liberty; these are the characteristics of the pioneers, and it is because of them that they break new paths. "Titans not Olympians, hewers of rocks not shapers." Would that some poet could seize the quality of mind of these pioneers and depict it for our instruction; show that with this love of liberty goes love of labour too—that their amateurishness is a quality and not a defect of mind, that from it springs the courage to attack old problems in new ways—to lead forlorn hopes against fortresses, impregnable if assaulted in accordance with the conventional methods of scientific warfare.

Of that glorious band of pioneers of an older generation, Sir William Crookes was the last; though surely others will succeed him—unchartered libertines of science, and like him straying from the beaten paths and macadamised roads of knowledge, will blaze new trails into the unknown.

Of Sir William Crookes' contributions to chemical and physical knowledge it is not necessary to speak here. His imagination led him to conceive of new elements, his skill enabled him to find them. By biologists he will always be remembered by his startling incursion into their domain and his fluttering of their dovecotes by the prophecy that unless use were made of atmospheric nitrogen as a food for plants the Wheat supply would prove inadequate for the feeding of the western world. So quick is the advance of technical science that though the warning was uttered little more than twenty years ago—at the meeting of the British Association at Bristol in 1898—the danger it announced is warded off; and, thanks to the chemists' discoveries of means of combining atmospheric nitrogen, there is in the world to-day, and likely to be for a long time to come, rather a glut than a shortage of nitrogenous food for plants.

Sir William Crookes died on April 4, at the age of 86. Born in London, on June 17, 1832, he spent nearly the whole of his long life there; but his mind was voyaging always throughout the remote regions of the universe in the quest of the unknown and the curiosity of his genius would not be sufficed with the discovery of the nature of this material world. It urged him to seek knowledge also of that which lies beyond.

Liverpool Flower Show.—The Liverpool Horticultural Association will hold a small Show of vegetables and flowers in the Corn Market, Liverpool, on August 13, 14, 1919.

Royal Horticultural Society War Relief Fund.—The matinée at the Palladium on Friday, the 4th inst., in aid of the Serbian section of the Horticultural Relief Fund was a great success, and as a result £1,000 will be allocated to Serbia. The Palladium was filled with a distinguished and appreciative audience, which included Lord Grenfell, Lady Northcote, Lady Bective, Lady Clementine Walsh, and Miss Balfour. Gifts auctioned by Mr. Charles F. Higham, M.P., realised over 100 guineas.

Bee-keeping.—Mr. W. Herrod-Hempsall, of the British Bee-keepers' Association, one of the Board of Agriculture experts in bee-culture, is at present in Holland arranging for the transport of stocks to be supplied on easy terms to the county horticultural organisations and there used as the basis of large restocking enterprises. Every attention is being given to the necessary details with a view to ensuring the success of this effort to rehabilitate an interesting and profitable rural industry.

Dr. John MacWatt.—Dr. John MacWatt, of Morelands, Duns, Berwickshire, has been appointed a Justice of the Peace for that county. To gardeners Dr. MacWatt is best known as an authority on Primulas, of which he cultivates a large and representative collection in his interesting garden at Duns.

Retirement of Mr. James Hudson, V.M.H.—After a period of forty-three years' service as gardener at Gunnersbury House, Acton, Mr James Hudson is retiring in May next. During this long period he was for thirteen years gardener to Mr. Henry John Atkinson, and for thirty years with the late Mr. Leopold de Rothschild and his family. Mr. A. Bedford, for many years general foreman under Mr. Hudson, will succeed him in the charge of the gardens at Gunnersbury House.

British Gardeners' Association.—A reunion of members of the British Gardeners' Association resident in or near London is to be held at Anderton's Hotel, Fleet Street, on Wednesday evening next. Demobilised soldiers and sailors and the friends of members are invited to attend.

Land for Ex-Soldiers.—In the week ending April 5 the Board of Agriculture approved of purchases of land by County Councils under the Small-holdings and Allotments Act, 1908, amounting in all to about 1,400 acres, the counties concerned being Bedford, Norfolk, Lincoln, Somerset, Suffolk, Monmouth, Anglesey and the county borough of Walsall. Since the commencement of the year the Board has approved the purchase of about ten thousand acres in England and Wales, and proposals are now before the Board for the acquisition of about 60,000 acres, the greater part of this land being intended to provide small-holdings for ex-Service men. Although the arrangements for acquiring land for small-holdings are being carried out for the most part on a voluntary basis and in the friendliest spirit, difficulties have arisen in a few places

Here the county councils propose to utilise the compulsory powers of the Board. It will be of interest to the general public to learn that in response to Lord Ernle's recent appeal to landowners for land suitable for small-holdings, 120 offers, representing 18,500 acres, have been received.

Flowers in Season.—Mr. E. Knight has sent us from Mamhead Park Gardens, Kenton, near Exeter, a new Violet named Mamhead Queen. The petals are white, slightly tinged with mauve at the tips. The novelty has the delightful fragrance which makes the Violet such a favourite flower.

American Gooseberry Mildew.—In view of the prevalence of American Gooseberry Mildew last season in the Tamar Valley and other districts in the south-west of England, the Board of Agriculture wishes to impress on growers the importance of spraying their Gooseberry plantations with lime sulphur this season in time to prevent a recurrence of this disease on the berries. In plantations which suffered badly last year an attack this summer is certain, even where tipping has been carefully carried out, as some of the winter spores of the mildew are almost sure to have been overlooked. A thorough application of lime sulphur effectually prevents the spread of the mildew for two or three weeks, or longer, according to weather conditions. If the season is a normal one, the first spraying in an early district like the Tamar Valley should be completed before the 19th April, and should be followed by a second spraying about three weeks later, if any mildew appears on the young, growing tips. This second spraying should not be applied until after the early berries are picked (as otherwise they will be marked with lime sulphur), unless a very bad attack is foreshadowed by the rapid spread of the disease on the young tips and to the smallest berries. It should be thoroughly understood that lime sulphur is a preventive of the disease and not a cure. On this account it is essential that the first application should be made before the white stage of the disease has appeared. Lime sulphur spray fluid is prepared by mixing one gallon of concentrated lime sulphur (sp. gr. 1.3) with 30 gallons of water. On certain varieties, i.e., Keepsake, Lancashire Lad, Crown Bob, and Freedom, the spray fluid at this strength is liable to cause leaf scorching, and in consequence the fluid should then be applied at half strength, namely, one gallon of concentrated lime sulphur (sp. gr. 1.3) to 60 gallons of water. Attacks of Gooseberry Saw-fly are also to be expected, and should be dealt with at the first signs of attack and not two or three weeks later, when partial defoliation has taken place. This pest may be kept in check by adding 6 lbs. of Hellebore Powder to every 30 gallons of the dilute lime sulphur solution.

Special Fruit Exhibitions at the R.H.S. Meeting.—The Council of the Royal Horticultural Society has adopted the recommendation of the Fruit and Vegetable Committee to hold special exhibitions of fruits at certain fortnightly meetings in 1920, to which reference was made in *Gard. Chron.*, March 15 last, page 130. An exhibition of late home-grown Apples will be held at a meeting in March, 1920, at which American and Canadian Apples will be staged for comparison as to quality and weight, and an exhibition of early Apples, bush fruits, and stone fruits will be held at one of the meetings in August, 1920. The Fruit Committee has been asked to co-operate in the compilation of the schedules for these special competitive exhibitions.

Sale of Orchids.—The collection of Orchids formed by the late F. M. Ogilvie, The Shrubbery, Oxford, was sold by auction on April 1, 2 and 3 by Messrs. Protheroe and Morris. Although a comparatively small collection the sale realised £5,597. The best plants, although obtaining fairly good prices, were relatively cheaper than some of the good forms of more ordinary things. Two plants of Brasso-Cattleya Cliftonii Fowler's variety, realised 50 guineas and 40 guineas respectively; B.-C. Cliftonii magnifica, 27, 24, 20, 17, 14, and 10 guineas respectively. Odontioda Armstrongiae var. Peerless sold for 45 guineas; Oda. Memoria F. M. Ogilvie, 45 guineas; Oda. Florence, 18 guineas; Oda. Bradshawiae Perfection, 14 and 13 guineas; Oda. Brewii cupreum, 14 guineas; and Oda. Zenobia, 35 guineas. Odontoglossums maintained their reputation for realising high prices; Odm. Mirabeau var. Mastiff, found a purchaser at 100 guineas; Odm. Harwoodii, Shrubbery var., realised 50 guineas; O. crispum The Britisher, 32 guineas; O. crispum Magnum Bonum, 22 guineas; O. crispum Ronald, 21 guineas; O. illustrissimum splendens Shrubbery var., 44 guineas. Cattleyas, Laelio-Cattleyas, and other Orchids found ready purchasers.

War Items.—The many friends of Mr. James O'Brien will be interested to learn that his son, James has been gazetted Brigade-Major, to date from October 1st, 1918, since when he has been doing duties on the Staff in the Salonika area. Mr. O'Brien's other son, Captain John O'Brien, is still serving with the King's African Rifles in East Africa: he took part in the arduous campaign in German and Portuguese East Africa. Major James O'Brien is only twenty-five, and his brother, John, twenty-four years of age.

This plant has stems one to two feet high, well clothed with shining green leaves and axileary, greenish-coloured flowers in April. Another more attractive species is F. bucharica, which grows about one foot tall and bears racemes of pure white flowers. Unlike F. Sewerzowii, the plant illustrated appears to be short-lived in many places, the bulbs tending to disappear after a time. But a stock may be maintained by raising seedlings periodically.

Plants for Dry, Shady Places.—"Gardener," writing in *Irish Gardening*, March, 1919, recommends the following plants for planting in dry, shady places:—Aucuba, Mahonia (Berberis Aquifolium), which should be well watered when planted; Ruscus aculeatus, which, with Periwinkle and Ivy, will thrive even under old Yews; Euphorbia amygdaloides; and if light is not too deficient, Hypericum calycinum, which, though flourishing in sun, is not intolerant of shade, and will grow in the poorest soil. Euonymus japonicus, with attention, will establish itself in dry, shady places, and so will Euonymus radicans. Aquilegias will sometimes become naturalised under trees, but seedlings generally revert to the purple, short-spurred type.

FIG. 77.—FRITILLARIA GIBBOSA: FLOWERS, ROSE PINK TO WHITE.

Fritillaria gibbosa.—The charming little plant illustrated in fig. 77 under the name Fritillaria gibbosa is sometimes known in gardens as Rhinopetalum Karelinii. It has been in cultivation in this country at various times since the year 1836, when it was received at Chelsea from Petrograd. The specimen illustrated is small compared to some of the wildlings, which often grow to a height of 6 inches to 9 inches, and bear up to twelve flowers in a loose raceme. The blossoms vary in colour from rose pink to almost white, with deeper-coloured spots on the segments, and with a green and purple-coloured base. The bulbs are always found very deeply buried, and in most wild specimens the greater length of stem is shown to have been under the soil. The stem is furnished with two broadly lanceolate leaves near the base and others that become narrower near the inflorescence. F. gibbosa is found in Persia, Turkestan, and on the borders of Afghanistan, and belongs to a small, distinct section of the genus which includes amongst others the well-known F. Sewerzowii, also known as Korolkowia Sewerzowii.

On a dry shady bank, beneath trees, Claytonia perfoliata seeds and comes up well annually. Campanula Trachelium, if given a fair start, may succeed.

AGRICULTURAL EDUCATION OF THE SOLDIER.

MUCH has been written of the arrangements for giving educational facilities to the soldier during the process of demobilisation, in order to fit him for a future career.

Perhaps in no case of education in France has greater care been taken, than in the case of agriculture, to provide schools and educational centres where the soldier might receive a training which would enable him to appreciate the necessity of greater production from the land in the future.

While demobilisation has been in progress, agricultural educational centres have been set up under the combined efforts of the Training Branch of the General Staff and the Directorate of Agricultural Production throughout France and Belgium and even in Germany.

The Director of Agricultural Production, the Earl of Radnor, has insisted on practical instruction being given, and the schools have, for the most part, been so constituted as to give this training.

A typical agricultural school is hereafter described, and the particulars may be found interesting, especially as the students attending the classes are all given a certificate as to their capabilities and as to the instruction they have received. The First Army school at Etrun, near Arras, was one of the first schools to be inaugurated (see fig. 78), as it was recognised from the time the great advance commenced, that it was probable, even if victory did not come as early as eventually it did, that a time was fast approaching when the education of the soldier would have to be undertaken.

With a view, therefore, of finding a suitable centre, early in August, 1918, Colonel J. H. Forrester Addie, Deputy Director of Agriculture in France, and Captain J. D. Davidson, Agricultural Officer, First Army, made a tour of inspection, with a view of selecting a site for the foundation of an agricultural school. It was desired to obtain a site which, while giving facilities for the accommodation of the intending pupils, should not interfere with the natural requirements of the returning French inhabitants. Such a site was found at Etrun, which village is just outside the border of the devastated area around the town of Arras. In this village a farm of some 300 acres in extent was selected, the owner of which was a widow who had lost all male relatives in the war, and who had not labour to carry on the work of the farm. Although the village has suffered somewhat from shell fire, sufficient houses and buildings were intact to ensure accommodation for men and animals.

The owner of the farm welcomed the establishment of the school, and readily placed at the disposal of the Directorate the buildings, land, implements and animals—in return for the labour and feeding of the cattle afforded to her.

Close by, camps which had held troops were available for the accommodation of the pupils, and a staff of instructors was selected to carry out the work of instruction. Education was given both by practical demonstration and by means of lectures in the following subjects, and the instructors in these subjects were as follows:—Agriculture, Capt. J. D. Davidson and Lieut. P. McKenzie; Soils and Manures, Botany and Horticulture, Lieut. Weir, M.C.; Dairying, Lieut. Robson; Horse Management and Veterinary Hygiene, Lieut. Kent; Management of Piggeries, Capt. Emmett; Surveying, Lieut. Miller; Plant Diseases, Capt. B. T. Dickson; Agricultural Organisation, Lieut. P. McKenzie.

Classes under selected N.C.O.'s were also held in the following subjects:—Farriery, Saddlery, Woodwork, and Ironwork.

Lieut. Robson took over the small dairy herd belonging to the owner of the farm, consisting of ten Normandy milch cows. Under his instruction a small building was converted, with the help of prisoners of war, into a practical and hygienic dairy. The wooden vessels, hands and bowls, were made by prisoners of war, and the products of the dairy were sold to the officers messes of the surrounding units.

The piggeries were also taken over, repaired and modernised; the pigs of the farm were purchased, and these sufficed as material for a practical demonstration in the management of a piggery.

FIG. 78.—ARMY SCHOOL OF AGRICULTURE AT ETRUN, NEAR ARRAS, FRANCE.

The lecture hall was fitted up and lighted with electricity, providing a comfortable recreation room for the long winter evenings, and lantern lectures were given there weekly on agricultural subjects.

Each month since November, twelve officers and forty men have been passed through this school, and it is noticeable that there has been a great demand and competition to obtain an allotment of vacancies for the courses which were held.

The school, under the progress of demobilisation is drawing its activities to a close, but good work has been done there, and few of the students who have attended the courses will look back with regret on the days which they passed at Etrun. The photograph reproduced in fig. 78 shows the instructors and some of the students attending the second course.

Magnesium Carbonate Injurious to Plants.—Owing to its insolubility in water, magnesium carbonate is commonly supposed to be harmless to plants. Mr. H. Coupin, however, finds that except in some special cases, for example the Stone Pine, the presence of magnesium carbonate is harmful to the germination of seeds, the growth of the root and rootlets is checked and the stems are also in most cases dwarfed. The action is probably due to magnesium carbonate passing into solution in water containing an excess of carbonic acid.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Gardeners' "Victory" Memorial (see pp. 129, 169).—I thank Mr. Beckett for regarding my question as worthy of notice and support; and it only remains for the committees of the Gardeners' Royal Benevolent Institution and the Royal Gardeners' Orphan Fund to formulate a scheme and method of appeal. I see more in the Tablet scheme as it develops, especially as a local tribute to the fallen gardener, and I shall endeavour to adopt it here. *A. Cranstone.*

Revision of Pritzel.—Pritzel's index to figures of plants is purely botanical in intention and interest. It is, therefore, not of much practical value to horticulturists; certainly not sufficient to warrant the spending of a large sum of money on its revision by the Royal Horticultural Society, or any other horticultural body. The names used for the figures in Pritzel are not reliable, many of them being inaccurate, and they will continue to be so in the new edition. To set them right would entail more labour than either Kew or the Natural History Museum could afford to give. Pictures of garden plants with botanical names might be indicated in Pritzel, but even that would not be of much practical value. What constitutes a garden plant? There are hosts of plants in cultivation which are not of the slightest horticultural interest. Are plants grown in tropical countries to be admitted? When we get down to varieties, kinds, and sorts of garden plants, are all the pictures of Roses, Carnations, Daffodils, Tulips, Pelargoniums, Auriculas, and Dahlias, of Apples, Pears, Grapes, Plums, and Strawberries; of Cabbages, Peas, Turnips, Onions, and Potatos; and of the hundreds of other garden things to be included? Is not the whole thing rather ridiculous? If the leading horticultural papers would each issue a complete index of subjects and pictures of plants published in their pages, from the commencement, to save the trouble of wading through the indexes for each volume, that would be something, but the proprietors would probably find the game hardly worth the expense. Why waste labour and money over matters of little account? If botanists desire to have Pritzel brought up to date, let them pay for it. *Practical.*

Potato Spraying.—I was interested in the remarks on Spraying made by *Market Grower* in your issue of March 8. There is no doubt that the Knapsack Sprayer is a very cumbersome machine, and, in the hands of the unskilled, often ineffective. In my Potato Spraying trials in Dorset, I used a Drake and Fletcher 12-gallon manual with great success, as in the report on my trials, published in *The Board of Agriculture Journal* for January 19. In one trial I worked the machine with four schoolboys under 14 years of age even up a considerable gradient. I also tried four land girls for three days (their first experience in spraying), and they were able to work the machine without fatigue and enjoyed the work. In the hands of expert sprayers, four men or women should be able to cover four acres of Potatos on a working day—two spraying, one pumping, and one mixing and supplying the machine. The machine was tested with a gauge, and gave a working pressure of 50 lbs. with both branches working. From my experience, I am convinced that nearly every failure of Potato spraying to prevent late blight could be attributed to the bad work done by the knapsack in the hands of inexperienced workers, who simply "dribbled" the solution on the upper surface of the leaves. If the various County Councils had invested in a manual machine, instead of in two or three knapsacks, the work would have been done much more cheaply and have been more effective. The machine is suitable for fruit and other spraying, with the addition of lances for taller trees. As these machines are somewhat costly, County Councils and other bodies should be able to lease them at a small charge per day. There are many people who would be glad to use such a machine if it were available at a reasonable cost. Others, seeing the benefit of such work, would be encouraged to follow suit, to the great benefit of the nation Until a proper system of spraying is instituted there is little

hope of remunerative fruit growing in this country. The same may be said of late blight in Potatos. The Potatos nearest the control plot (i.e., those unsprayed) in my trials were much more diseased than those further away, showing that the spores of the disease from the control had contaminated them. I consider the demobilisation by the Board of Agriculture of the Potato spraying organisers is to be regretted; they were doing good work. Spraying as a preventive of disease, both in fruit and vegetables, is not appreciated enough. Most of the fungous diseases that at present worry us could be prevented by the timely use of fungicides. Another drawback to spraying in the case of late blight in Potatos is the cumbersome preparation of Burgundy mixture in barrels and the time it takes to prepare. There are many proprietary mixtures on the market, some practically useless, but a few very good, and better in their effect than the home-made mixture. One of these has been introduced by the Mond Nickel Company, known as "Blighty" Burgundy Mixture. It immediately dissolves in water, and remains in suspension for a long time, does not clog the nozzles, and is most effective in warding off blight, as it remains on the foliage longer than most sprays. The makers advertise it as 2 per cent. solution, and at that strength (if properly applied and on the underside of the leaf) gives complete immunity to the Potato from late blight. From reports I have received, Onions sprayed with 1 per cent. "Blighty" Burgundy Mixture were immune from mildew, and it should be effective for Strawberry mildew and leaf spot. Possibly a ½ per cent. mixture of "Blighty" on Cox's Orange Apples would not affect them adversely, and probably would be effective against scab. *J. E. Mackenzie, 38, Strathearne Road, Wimbledon, S.W.19.*

Spraying for Big Bud Mite (see pp. 141, 156). In reply to your correspondent Mr. Geo. M. Taylor, I may point out that most of his points have been raised because he has evidently not seen the original report. I am sending him a copy, which I hope will clear up the points at issue. For the sake of other readers, however, I should like to explain that the attempt was being made to kill the big buds and therefore the enclosed mites during the dormant season. A ten per cent. solution of soft soap has considerable penetrative powers into big buds, and it was hoped, by adding carbolic acid, to kill them. It succeeded in the more open big buds at the base of the shoots, but not in the more tightly closed buds at the apex of the shoot. Enough material was thus left unkilled even after three separate sprayings to provide infection in the following year. The method, therefore, failed as a practical proposition. Mr. Taylor's remarks on spraying are interesting, showing that he has succeeded in completely controlling the pest. He has, however, apparently to do at least ten—possibly eleven—sprayings. That would, I feel sure, cost more than the fruit is worth, and therefore will not be likely to appeal to the commercial grower. What is wanted is a method applicable to commercial growing, and that I consider has not yet been discovered. *A. H. Lees, Agricultural and Horticultural Research Station, Long Ashton, Bristol.*

Tomato Seedlings Damping Off.—With reference to Mr. Wm. Taylor's letter on the above subject, in your issue of March 29, p. 157, I should like to call attention to some facts which are given in my original paper on this disease,* but which do not appear in the short note on p. 142 of *The Gardeners' Chronicle*. Batches of "damped-off" Tomatos from several different sources have been found to be infected with a form of Phytophthora, and though this does not prove that the fungus is the cause of the damping-off, it certainly indicates the probability of it, for Phytophthora is almost unknown except as a parasite. It was evident that the fungus was not Phytophthora infestans or any other well-known species of Phytophthora, and for some time the species was not identified. But I have also direct experimental proof that the Phytophthora causes damping-off. A large proportion of seedling Tomatos growing in soil in which plants in a previous year had been diseased, damped-off, and were found to contain Phytophthora. Clean soil inoculated with infected soil or with pieces of infected plants produced the same effect, while inoculation of healthy seedlings with small portions of stem containing Phytophthora also caused the typical symptoms of damping-off. Seedlings grown at the same time in exactly similar conditions and receiving identical treatment, except that no infected material was allowed to come into contact with them, never developed the disease. These facts appear to prove conclusively that damping-off of Tomato seedlings is often due directly to the attacks of this form of Phytophthora. This does not exclude the possibility of other cases of damping-off being caused, as suggested by Mr. Taylor, by unsuitable temperature and humidity when seedlings are transplanted. As regards other points raised by Mr. Taylor, I may say that I have seen damping-off in the seed-pan when the seeds have been sown in infected soil. The same Phytophthora also attacks much older Tomato plants, causing what I described in my paper as "Collar-rot," though in this case I do not know at what stage of its growth the plant is infected. I am, however, more familiar with the damping-off form of the disease. Dr. G. H. Pethybridge and Mr. H. A. Lafferty have recently published,† as the result of quite independent work, an account of a Tomato disease which they have named "foot-rot," and which is caused by a Phytophthora. This disease is evidently identical with my "collar-rot," and is caused by the same fungus. Dr. Pethybridge and Mr. Lafferty have proved by inoculation experiments with pure cultures of the Phytophthora that it is the cause of the disease. They have also succeeded in obtaining the sexual form of the fungus and, finding that it had never before been completely described, they have named it Phytophthora cryptogea. *G. T. Spinks.*

* *Annual Report*, Agricultural and Horticultural Research Station, Long Ashton, 1917.

Gardeners' Hours and Wages.—The letters appearing under this heading (pages 144 and 157) must have been read with interest by many gardeners, and I feel that we owe a debt of gratitude to the editors of this paper for opening their columns for the discussion of this important subject. Many employers of gardeners either cannot or will not read the signs of the times. I do not think that gardeners as a class are more avaricious than other people, yet in many instances no sooner does the gardener put forward a plea for a reconsideration of his financial position than the stale old arguments are trotted out which are nothing but thinly-veiled threats. I cordially agree with *H. Chivers* that if employers cannot pay gardeners a living wage it would be far better if so-called "luxury gardening" were dropped. Personally, I believe that one of the greatest difficulties we have to contend with is the lack of an authorised standard of hours to be worked in gardens and a standard minimum wage to be paid for such work. The best proof of "the friendly spirit of consideration," to which Mr. Elwes refers on page 157, would be for all employers who have not already raised the wages of their employees in the garden to the level of equal purchasing power with that of his wages in 1914, to do so at once, paying up all arrears and apologising for their previous tardiness. Cases have repeatedly come to my notice in which a man who has been fighting for his country has been offered a wage of 24s. per week. On the other hand, to be perfectly fair, I know of employers who on their own initiative have advanced their gardeners' wages from 5s. to 20s. per week. Many, however, are paying less than the minimum fixed for the agricultural labourer. Would it not be possible for the Royal Horticultural Society to form a committee of employers and practical gardeners to consider this question and to formulate some scheme of gardeners' wages, hours, duty, and overtime, which should be recognised by its Fellows, and would in time be taken as the standard to apply to gardeners generally? *Reconstruction.*

† *Scientific Proceedings of the Royal Dublin Society*, Vol. XV, No. 36. (Feb., 1918).

SOCIETIES.

ROYAL HORTICULTURAL.

APRIL 8.—Notwithstanding light showers of rain during the day, there was a remarkably good attendance at the meeting of the R.H.S. held at the London Scottish Drill Hall, Buckingham Gate, on Tuesday last. The exhibition was of moderate size, bright, and interesting, the principal subjects being Daffodils, Orchids, Carnations, Saxifrages, and Azaleas. The Floral Committee had a busy time, and granted four Awards of Merit (three to Freesias) and twelve medals to groups. The awards made by the Narcissus and Tulip Committee were four Medals, one First-Class Certificate, and two Awards of Merit. The Fruit and Vegetable Committee granted one Medal, and the Orchid Committee recommended three Awards of Merit to novelties and awarded four medals for collections.

Floral Committee.

Present: Messrs. Henry B. May (in the chair), W. J. Bean, S. Morris, J. W. Barr, John Green, C. R. Fielder, John Heal, Geo. Harrow, W. Howe, H. R. Darlington, Chas. E. Pearson, George Paul, J. W. Moorman, C. Dixon, John Dickson, W. P. Thomson, Jas. Hudson, E. H. Jenkins, G. Reuthe, W. B. Cranfield, W. H. Page, J. Jennings, and J. W. Blakey.

From many points of view the series of seventeen varieties of variously-coloured Freesias shown by Mr. R. DALRYMPLE, Bartley, Hampshire, was the most interesting display, as it demonstrated in remarkable fashion the colour progress already made in these flowers; there were mauve, rose, yellow, golden, brown, soft red, and lilac shades among the flowers, and in many cases the blooms are widely expanded and have lines of colour in the tube, as in the case of many Streptocarpuses. Mrs. EDWARDS showed seedling Saxifragas, and Miss C. WARNER, Hawkhurst, was awarded a Cultural Commendation for large spathes of Richardia africana (Arum Lilies).

AWARDS OF MERIT.

Freesia Bartley Mauve.—A lovely, sweetly-scented variety of neat shape. The flowers are widely expanded and the colour is light mauve, with darker stripes running down into the whitish tube.

Freesia Bartley Rose.—This charming Freesia has widely open flowers of a soft rose shade, with deeper lines of colour running down into the white tube, and a little yellow colouring about half way down the lower segment. This variety appears to have little or no fragrance, but it carries numerous flowers on each spike.

Freesia Bartley Goldfinch.—A bright yellow variety, with light orange shading on the lower segment. The flowers are of fair size and well open. Goldfinch is the finest yellow Freesia we have seen, and a notable advance in the yellow shades. The above-named Freesias were shown by Mr. R. DALRYMPLE, Bartley, Hampshire.

Primula Wanda.—A handsome hybrid obtained by crossing Primula Juliae with a crimson form of P. acaulis. The plant is of neat and robust habit, with rounder and shorter leaves than in P. acaulis. The flowers are so freely borne that they almost hide the foliage; the individual pips are slightly larger in diameter than half-a-crown, and their colour is deep, dark purple blue, with a golden eye, or velvety purple, with ruby flushing and an orange-yellow eye. Shown by Messrs. BAKERS.

GROUPS.

From the R.H.S. Gardens, Wisley, was brought a collection of Alpine plants in large pans. Some of the best subjects, splendidly flowered, were: Saxifraga oppositifolia splendens, S. apiculata, S. Lindsayii, S. Petrachii, S. scardica obtusa, S. Bissolettii, Anemone ranunculoides and Soldanella montana (Bronze Flora Medal). Messrs. R. TUCKER AND SONS showed Saxifragas in great variety, in small pots, all beautifully flowered—S. marginata, S. Burseriana Gloria, S. Paulinae, S. Sundermannii, S. Elizabethae, and S. Griesbachii were all in fine

form (Silver Flora Medal). Ramondia Nataliæ and Bridgesia spicata were notable plants, with Viburnum Carlesii in a group staged by Messrs. J. Piper and Sons (Bronze Flora Medal), Mr. E. Reuthe (Bronze Flora Medal), Messrs. J. Cheal and Sons (Bronze Flora Medal), Mr. G. W. Miller (Silver Banksian Medal), and Messrs. W. Cutbush and Son all showed hardy plants, and the latter added Carnations to their display.

The Roses shown by Mr. Elisha Hicks were delightful, and there was no lack of admirers for the sheaves of Mrs. Charles E. Shea, Joanna Bridge, the new white, scented Mrs. Elisha Hicks, Madame Edouard Herriot, and Climbing Lady Hillingdon (Silver-Gilt Banksian Medal). Under arching branches of the Yellow Banksian Roses, Mr. G. Prince showed specimem blooms of popular varieties of H. T. Roses (Silver Banksian Medal).

Acacia longiflora, A. pendula, A. armata, A. diffusa and A. Riceana were charming in the group staged by Messrs. Stuart Low; these with Chorizemas, Grevilleas and Epacris flanked a bright exhibit of Carnations (Silver Banksian Medal). Messrs. H. B. May and Sons showed Boronia megastigma, Genistas and Cinerarias (Silver Banksian Medal). Messrs. Allwood Brothers brought up a handsome set of Carnations and showed their Mary Allwood in excellent colour (Silver Flora Medal). Splendidly flowered specimens of Azaleas Petrick, Hexe, and Pink Pearl were shown by Mr. L. R. Russell, who also exhibited Erica mediterranea hybrida, and E. herbacea carnea, in pots. (Silver Banksian Medal.)

Fig. 79.— A PORTION OF MESSRS. SUTTON AND SONS' EXHIBIT OF EARLY VEGETABLES.

Orchid Committee Societies.

Present: Sir Jeremiah Colman, Bart. (in the chair), Sir Harry J. Veitch, Messrs. Jas. O'Brien (hon. secretary), W. H. White, W. J. Kaye, W. Bolton, C. J. Lucas, Walter Cobb, W. H. Hatcher, T. Armstrong, J. E. Shill, Arthur Dye, S. W. Flory, A. McBean, E. R. Ashton, Pantia Ralli, R. G. Thwaites, R. Brooman White, Stuart Low, R. A. Rolfe, Frederick J. Hanbury, and Gurney Wilson.

Awards of Merit.

Odontioda Margaret Gatton Park variety (Odm. ardentissimum × Oda. Bradshawiae), from Sir Jeremiah Colman, Bart. Gatton Park (gr.. Mr J. Collier). A remarkable and beautiful variety, differing in colour and form from any previously shown. The finely-formed flower is bright mahogany-red, with a clear violet shade: the lip has a bright yellow crest. It is one of the best of the dark-coloured varieties. The formation of a practically self-coloured hybrid out of the variously-coloured parents is very singular, and only to be accounted for by the influence of Cochlioda Noezliana in Oda. Bradshawiæ.

Odontioda Gladys superba (Odm. Pescatorei × Oda. Bradshawiæ), from Dr. Craven Moore, Victoria Park, Manchester. An exceedingly pretty hybrid, shown in fine condition, with two spikes bearing together fifty-four flowers. The margins of the segments are light mauve, and the inner two-thirds white, with attractive red spotting. The front of the lip is bluish-white.

Miltonia Venus Orchidhurst variety (vexillaria × Phalaenopsis). A great advance on former varieties, approaching closely to M. vexillaria in size and form. The sepals and petals are white, tinged with pale mauve; the lip is white, with strong dotted lines of ruby-red, extending from the yellow base.

Groups.

Sir Jeremiah Colman, Bart., Gatton Park, Surrey (gr., Mr. J. Collier), staged a selection of fine Lycastes, the best of which were Lycaste Skinneri Ernest Ashworth (a large form with bluish-white sepals and ruby markings on the lip), L. S rosea, and the showy hybrid L. Mary Gratrix, with reddish-claret flowers.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr., Mr. Thurgood), was awarded a Silver Flora Medal for a group of Cattleyas, Laelio-Cattleyas, Odontiodas, and Odontoglossums, with a selection of Cymbidiums. Cymbidium Lady Colman, variety auriferum, of a clear gold shade with reddish lines, and C. Alexanderi roseum were especially good. Sophro-Laelio-Cattleya Pittiæ (S.-L.-C. Marathon × C. Maggie, Raphael alba), with Cattleya-like flowers, white with purple lip; and Cattleya Empress Frederick Rosslyn variety, with bright rose-coloured sepals and petals and dark purple lip veined with orange colour, were also noteworthy.

Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells, were awarded a Silver Flora Medal for an excellent group of finely grown Odontiodas, Odontoglossums, Miltonias, and Cattleyas, with Cymbidiums at the back. Among other fine novelties was Odontoglossum Violet Queen (illustrissimum × Doris), a large flower of bright violet-mauve colour, with a white margin; the lip has a bright yellow crest, with a red blotch in front. Odontioda Gloss, Orchidhurst variety (Odm. triumphans × Oda. Charlesworthii), another novelty, is a large flower with the firm texture of O. triumphans, the lip being abnormally developed and forming the chief feature. The colour is scarlet with an orange shade, the lip being of a lighter tone. Odontioda Orion (Oda. Coronation × Odm. percultum) is Odontoglossum-like in form, and in colour white, beautifully blotched with purplish-red.

Messrs. Charlesworth and Co., Hayward's Heath, were awarded a Silver Flora Medal for an effective group, principally of handsome hybrid Odontoglossums and Odontiodas, with a selection of their strain of hybrid Miltonias. Among other novelties were Odontioda Nada (Odontioda Red Cross × Odm. eximium), a model flower, bright claret red with white margin and tips); and Oda. lutescens (Oda. Schröderiana × Odm. crispum xanthotes), a charming flower with the inner parts of the segments cinnamon red, the margin being clear yellow. Cattleya Enid var. Queen of Roumania, Odontoglossum Radiant, and Odontioda Hilda (Odm. Dora × Oda. Royal Gem) were also shown.

Messrs. J. and A. McBean, Cooksbridge, were awarded a Silver Banksian Medal for a group in which fine hybrid Odontoglossums, and large typical white and xanthotes forms of O. crispum, were prominent. Some finely-grown Cymbidiums staged at the back, and a selection of Laelio-Cattleyas of good quality were also noted.

C. J. Lucas, Esq., Warnham Court, Horsham (gr., Mr. Duncan), showed excellent examples of the richly coloured Laelio Cattleya Lucasiana (C. labiata × L. tenebrosa), the golden-orange L.-C. Pattii (Adelina × luminosa), Odontioda Margaret, Odontoglossum Doris, and the large lavender-tinted O. crispum Rosy Morn.

Colonel Stephenson R. Clarke, C.B., Borde Hill, Cuckfield. Sussex, showed a very interesting new combination to which the title Clarkeara Paul was given. It resulted from a cross between Sophro-Laelia Psyche (Laelia cinnabarina × Sophronitis grandiflora) and Brasso-Laelia × Mrs. M. Gratrix (Brassavola Digbyana × Laelia cinnabarina). In size, form, and colour it resembles B.-L. Mrs. M. Gratrix the large size of B. Digbyana, which only shows in the fringing of the lip, being suppressed, and the form of the narrow-petalled L. cinnabarina accentuated. The lanceolate sepals and petals are copper-orange in colour; the lip is of lighter tint.

Narcissus and Tulip Committee.

Present: Messrs. E. A. Bowles (in the chair), F. Herbert Chapman, W. B. Cranfield, G. Reuthe, W. Poupart, A. R. Goodwin, C. Lemesle Adams, W. F. M. Copeland, and Herbert Smith; Rev. J. Jacob, Miss Willmott, and C. H. Curtis (hon. sec.).

A few new Daffodils were forthcoming and several interesting groups of the flowers were staged, but there was nothing like the pre-war displays at April meetings. The Peter Barr Memorial Cup was awarded for the year 1919-1920 to the Rev. Joseph Jacob "for good work among Daffodils," and the Engleheart Cup, for a dozen seedling and new Daffodils, went to Messrs. Herbert Chapman, who were the only exhibitors in the class.

First-Class Certificate.

Narcissus White Knight. This beautiful white Trumpet Daffodil is already well known to enthusiasts because of its purity and its exquisite form, the rolled frill of the mouth of the trumpet being a striking feature. An Award of Merit was granted to this Narcissus on May 2, 1916, and it now gains the higher and rarely-given honour. Shown by Messrs. R. H. Bath, Ltd.

Awards of Merit.

Narcissus Phineas.—A Jonquil hybrid of large size and incomparabilis form. The substantial perianth segments lack something of the best form and are light yellow, while the cup is of a deeper yellow shade and has a crimped and slightly frilled rim.

Narcissus Yellow Standard.—This is a very free flowering, large-sized incomparabilis Daffodil, with yellow perianth segments, often lightly mottled with very pale yellow, and a deeper yellow cup which has a goffered rim. Two 32-sized pots of this Daffodil were shown, and one had fifteen and the other eighteen flowers. These two Narcissi were shown by Messrs. Barr and Sons.

Fruit and Vegetable Committee.

Present: Messrs. Nix (in the chair), J. Cheal. G. F. Tinley, Owen Thomas, W. Bates. W. H. Divers. A. W. Metcalfe, E. Beckett. A. E. Vidler, E. M. Roach, G. P. Berry, and F. Jordan.

The only exhibit before this committee was a most interesting display of early vegetables from Messrs. Sutton and Sons (see fig. 79). The collection included Snow-White Broccoli (grown in Kent), Radishes, Sutton's Market Cucumbers, Golden Ball Lettuce, Sutton's Rhubarb, Chicory, Seakale, Mushrooms, Perpetual Spinach, and Harbinger Cabbages. Few exhibits attracted so much attention as this one. (Silver-Gilt Banksian Medal.)

CROPS AND STOCK ON THE HOME FARM.

TURKEYS.

Before the war I reared 200 turkeys yearly; last year my number was one dozen! With a more plentiful supply of food the rearing of turkeys will doubtless be increased during the present season. Many think that these birds are difficult to rear, and are thus deterred from the attempt. Yet this is not my experience, provided a few simple details are carried out. A lady once complained to me of the difficulties she found: in fact, she was so disheartened at the result that she determined to give up further attempts. She was successful in obtaining young birds, but they mostly died at three or four weeks old. I asked her how often during the day she moved the coops? She looked astonished at the question, saying: "Why, I only move them twice a week!" I replied that they should be moved twice daily, and if shifted three times, all the better. A hen and ten poults confined within a space of 4 square feet quickly taint the ground, and cleanliness is one of the most important details in the successful rearing of any poultry, and especially turkeys. Damp is another evil to be guarded against; a continuation of damp quarters is a sure cause of diarrhœa, one of the worst evils that can befall young turkeys.

A sunny situation, sheltered from north and east winds in a dry grass field, provide conditions favourable to success. For the first week it is well to have a board inside the coop of the same width and length as the floor of the coop. On this, spread a dry bag, which is more easy to change twice daily than cleaning the board. The removal of the droppings is important. With this arrangement the poults are living in warm, dry, sweet conditions. After the first week or ten days the board may be removed from the coop, allowing the hen to be upon the grass, which she enjoys, scratching and finding food for the poults.

Although turkey eggs will hatch equally well in an incubator, I prefer to use hens, because the poults grow better with the attention of the foster-mother. Ten eggs are sufficient for one good-sized hen to cover. With these large eggs, if more are added there is a risk of those on the outside not being well covered, and consequently not hatching well. Allow the hen to sit on false eggs for two or three days to ensure her being thoroughly broody before giving her the turkey eggs. At the end of ten days test the eggs to note their fertility. If one or more should be useless it is better to remove them, giving the hen the opportunity of covering the remainder more securely. As hatching proceeds remove the empty shells, as they may be the means of smothering the hatching poults by accidentally covering the end of an egg just chipped, thus excluding air and causing suffocation. Allow the poults to remain in the nest for twenty-four hours to become thoroughly dry and strong. No food is required by the poults during that period, as sufficient is absorbed into the system during hatching to last over that stage. The first feed should consist of soaked biscuit meal, a small portion of fine oatmeal, hard-boiled eggs and chopped onion, or "cliders." It will be noticed that the first food they take will be the onion; at all times for the first two months, in any case, onions should be used freely. For the first fortnight continue this feed three times daily, a little at a time. Should diarrhoea attack the poults discontinue the egg diet and add a little powdered chalk until the bowel slackness ceases. Give no water for the first six weeks; the soft and green food contains sufficient moisture. The hen should have water daily put in front of the coop, to be removed directly she has taken some. If pans of water are left standing about, the poults are sure to wade through them when passing in and out of the coop. In this way they get wet and cold and develop cramp and diarrhœa. A wire run in front of the coop is useful in curtailing their perambulations during showery weather, when they should be kept as dry as possible. When the grass is wet with heavy dews in the morning it is not wise to let young turkeys out of the coop too early.

Young turkeys revel in warm, dry conditions—a Jubilee summer suits them admirably, provided shade is given them with boughs, hurdles, or boards during the hottest part of the day.

WORK IN WOODS.

Where a regular annual rotation of cutting underwood is practised, the work should be completed by the third week in March, as the sap in the various kinds of shrubs and trees, and of hazel especially, is on the move by that date. In this country, where sheep are largely penned on arable land, wattle hurdles made from the various underwoods are largely in demand. This kind of hurdle affords much more protection to sheep than those made from split Ash with the rails placed some nine inches apart. For protection from the weather, wattle hurdles are much superior to the wide-mesh wire hurdles employed on some farms. Wattle hurdles are made 6 feet long, 3 feet wide, by splitting the bulk of the various woods, as hazel, ash, Euonymus and maple, the first-named principally, all interwoven together, which is quite a skilled art, and unfortunately likely to become extinct, as the younger generation do not care to learn. An experienced worker can make from ten to a dozen hurdles daily when the weather is favourable, and the present rate of pay is 9s. 6d. per dozen. The wood is cut down for them and laid in breadths suitable for handling (see fig. 80), thus facilitating the selection of the suitable "rods," as they are termed. About 3,500 rods are required for one "pile" of hurdles, consisting of ten dozen.

FIG. 80.—WATTLE HURDLE MAKING.

The hurdles are fixed in the field by stakes 5 feet long, commonly known as "shores"; these are held together by shackles made of wyths of galvanised wire, the whole then being made taut and firm.

In cutting breadths of underwood, which is done every nine or ten years according to the growth made, much other material is obtained beyond that for hurdles, all of which is useful on an estate or for sale. The larger wood, such as that of Ash, Ulmus campestris, so often confused with Wych Elm, and many other sorts are useful for fencing and other requirements on an estate, the rougher portions for firewood, which this winter has been a boon. *E. Molyneux.*

TRADE NOTES.

TWENTY-SIX years ago the growers of Morpeth and the district decided on forming a small association to protect themselves from trespass. After a while the need for this small society lapsed. Now the times demand something of wider scope. Morpeth is an important market-growing centre, and has been one of the first in that part of the Kingdom to recognise the necessity for organisation.

Mr. R. Wynne, Secretary of the Chamber of Horticulture, was invited to meet the Committee of the Morpeth Market Gardeners, Fruit Growers and Nurserymen's Association, at their headquarters recently, for the purpose of conferring with them as to the extension of their activities. After discussion it was decided to invite the neighbouring districts in Northumberland and Durham to unite with them in forming a centralised body for the two counties. The head office would be situate either in Newcastle or in Morpeth, and meetings of the joint associations could take place in the former city. All intensive cultivators are asked to communicate their views, and willingness to join in the movement, to W. Y. Price, Esq., Morpeth, or to the Secretary, Chamber of Horticulture, 11, Adam Street, Adelphi, London, W.C.2.

The Chamber of Horticulture has been requested to obtain statistics in relation to dumping, which term is understood to mean selling at prices not relative to the costs of production. Continental growers, who have more favourable conditions for growing in regard to wages, etc., are enabled to compete with British growers on other than equitable lines, and the time has now arrived when, in place of vague reports of dumping having taken place all over the country, chapter and verse should be supplied. Members of the trade are therefore cordially invited to send to the Statistical Assistant Secretary, Chamber of Horticulture, 11, Adam Street, Adelphi, London, W.C.2, full information regarding specific cases which have come under their notice.

Although not one of the few lucky nurserymen liable to excess profits duty, I was interested in the article on this subject in regard to husbandry on p. 172. Your correspondents' remarks remind me of the opinion I once heard expressed by an Income Tax recovery agent to the effect that it is doubtful if nurseries are properly subject to assessment under Schedule D (earnings),

but should only come under Schedule B (occupation of land) in the same way as farmers. I wish *H. M. V.* would express an opinion; it is a subject of importance to all nurserymen. I know that in some cases nurserymen have been foolish enough to pay Income Tax under both schedules. But the point I wish specially to know is, what distinction is made between nurserymen and farmers in the Finance Acts, and what is the legal definition of husbandry? In other words, under which schedule are nurserymen legally liable to assessment? Small city nurseries, chiefly glass, with a shop attached, are just like any other shop or business which is assessed upon its profits under Schedule D, but in the case of country nurseries using a large area of farm land for, say, the production of young fruit trees, is there any legal distinction between such husbandry and that practised by farmers, especially if the fruit trees are sold chiefly to farmers who grow fruit for market? It seems to me that a nursery of this kind, even when cultivating general nursery stock, should be assessed only under Schedule B in the same way as farmers. In conclusion, I should like to express appreciation of the space now devoted to Trade Notes in *The Gardeners' Chronicle*, and of the value to the trade of such articles as that of *H. M. V. Nurseryman.*

The Holt Seed Co., Salt Lake City, Utah, has provided their branch office at Caldwell, Idaho, with a flying machine equipped with a 360 horse-power engine. Urgent business at a distance of 150 miles can be covered in an hour's time, whereas the same distance for travelling by rail or motor requires a day's time. *The Seed World.*

Obituary.

Robert Johnson.—We much regret to announce the death of Mr. R. Johnson which occurred suddenly following an attack of paralysis at his home at Southport, where he has lived in retirement since the death of his last employer, Mr. Holden, in 1914. Mr. Johnson, who was aged seventy seven years, was a capable gardener and especially skilful in the cultivation of Orchids. During the time when he was gardener to the late Thomas Statter, of Stand Hall, Whitefield, Manchester, and afterwards to Mr. T. Statter, junior, he was a frequent exhibitor at the meetings of the Royal Horticultural Society and the Manchester and North of England Society. He grew Cattleyas very successfully and especially C. Dowiana aurea, C. Warscewiczii and hybrids. He gained several first-class certificates for Orchids, including C. Dowiana aurea Johnsoni, C. D. aurea Statteriana, C. Hardyana Statteriana, and C. H. Countess of Derby. His method of cultivation was as unusual as it was successful, and his plants were grown in a lofty intermediate house where little top ventilation was admitted but a general and restricted use made of the bottom ventilators. The plants were grown in cylinders and were suspended from the roof. They were kept dry during the resting season, watered liberally when the roots became active, and finally made aërial-roots several feet in length. A plant of Cattleya Lord Rothschild, with exceptionally long roots, was illustrated in *The Gardeners' Chronicle*, October 24, 1896, page 489.

John Mirrey.—The death is announced on March 27th of Mr. John Mirrey, stationmaster at Lochanhead, on the Glasgow and South-Western Railway. Mr. Mirrey was an ardent flower-lover, and his station was almost invariably in the first prize section in the awards for the best kept gardens on the system.

B. Wise.—We learn with regret of the death, on April 1, of Mr. B. Wise, for twenty-five years gardener to Sir Richard Harrison, Ashton Manor, near Exeter. Previously to his entering Ashton Manor he was for twenty-eight years gardener to the late W. H. Toomer, Grove Hall, Twyford, Berkshire. Mr. Wise leaves a widow and two sons—Frederick, gardener to Mrs. Molyneux, Loseley Park, Guildford, and Edward, gardener to F. G. Stewart, Esq., Oakwood House, Otterbourne, near Winchester.

THE APIARY.

By Chloris.

Hive-making.—In Fig. 81 is given a sketch of the exterior of the W.B.C. hive. **A A** show the slides of the entrance drawn a little way apart, as they would appear in the spring,

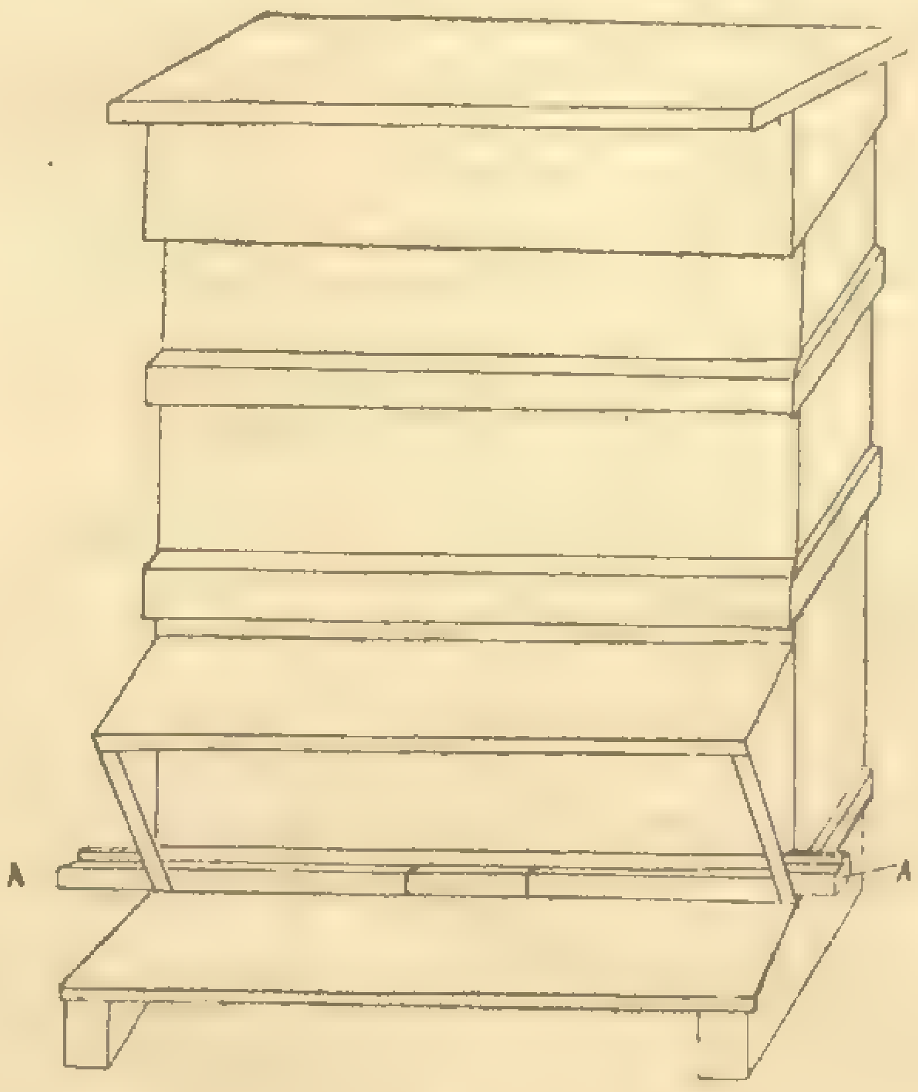

Fig. 81.—The "W.B.C." hive.

during April. From the section of the hive the floor-board is a little difficult to understand, but the sketch given in Fig. 82 will help to make it quite clear.

The frames are usually purchased in the flat.

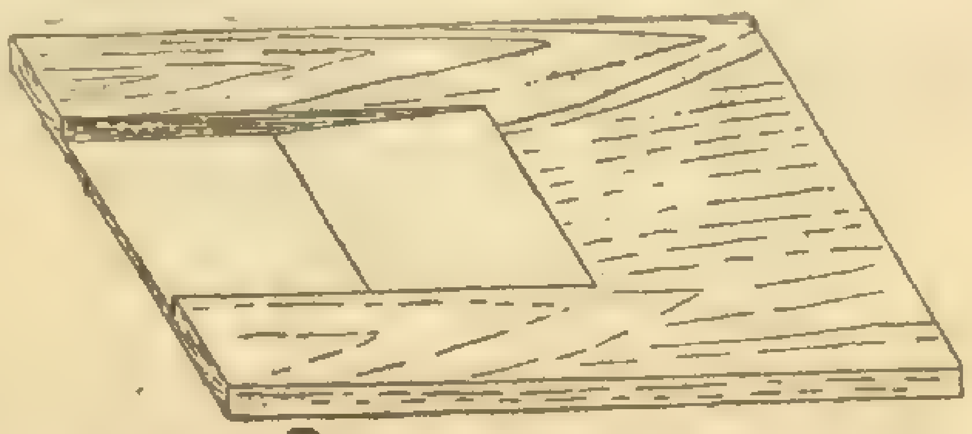

Fig. 82.—Floor board of "W.B.C." hive.

The illustration in Fig. 83 shows a brood-frame—shallow frames are much the same, only (as their name implies) they are not so deep, being $5\frac{1}{2}$ inches deep instead of $8\frac{1}{2}$ inches. The founda-

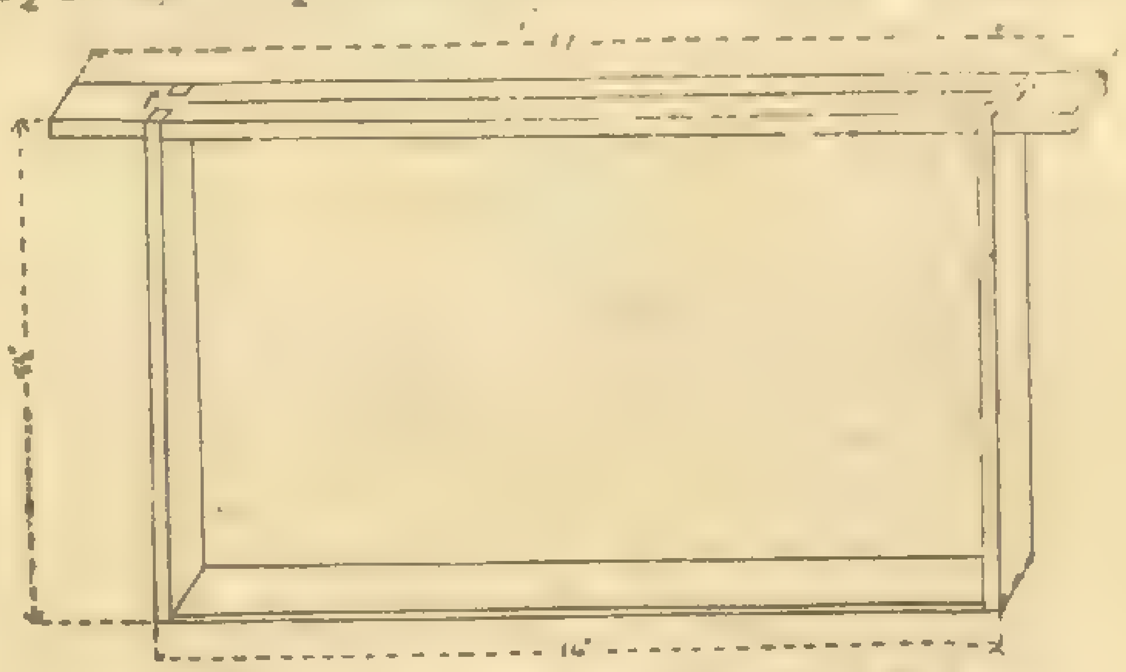

Fig. 83.—Bar frame for "W.B.C." hive.

tion, which is a sheet of wax impressed with the bases of cells on both sides, is fitted into the saw-cut $l^1 l^1$ and made secure by leaving a small portion of the foundation above the

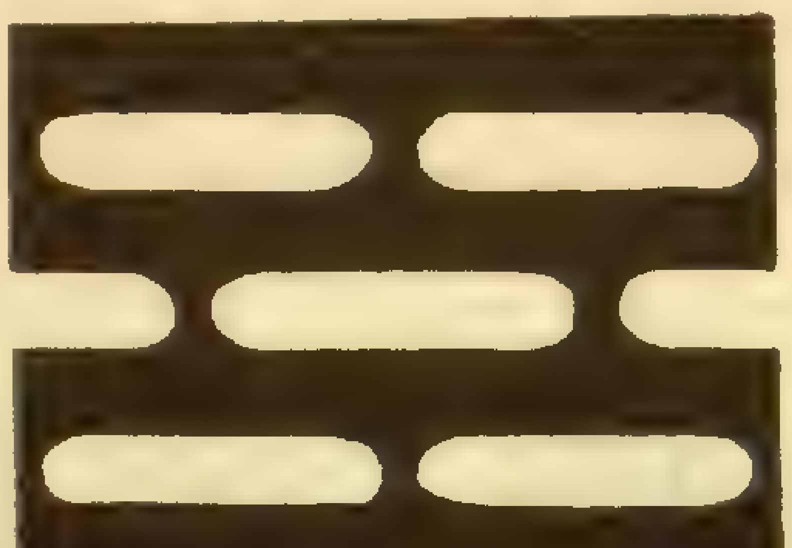

Fig. 84.—Queen excluder zinc.

saw-cut and then melting the part above with a hot poker. It is essential that the queen should be restricted to the brood-chamber, and in order to confine her to this portion of the hive a sheet of "queen excluder" zinc is used: a portion of a queen excluder is illustrated in Fig. 84. This allows workers to pass freely to any part of the hive, but will not permit the queen to do so.

The frames should be spaced correctly, and in order to do this easily, metal ends may be purchased to slip on, so that the distance from centre to centre of the combs is $1\frac{1}{2}$ inch. For the shallow frames, which are utilised for storing surplus honey, wide metal ends should be utilised.

ANSWERS TO CORRESPONDENTS.

Amount of Rain Contained in One Inch of Snow: *W. B.* An inch of snow contains one-tenth of an inch of rain.

Insect: *A.* The insect is a carabid larva; the grub of a ground beetle. These insects are beneficial, as they feed on slugs and similar pests in the soil.

Names of Plants: *W. M. M.* Coelogyne lactea, native of Burmah; described in *Gard. Chron.* of 1885, vol. xxiii., p. 692.—*O. B. S.* Boronia megastigma.—*C. D. J.* 1, Erica hyemalis; 2, Pteris scaberula; 3, Trichomanes reniforme; 4, Narcissus cyclamineus.

Pampas Grass: *M. T.* The clumps of Pampas Grass should be dug up, the dead parts removed, and the outside of the clumps divided into small healthy pieces. If required to be planted again on the same side, the ground should be dug deeply and enriched with decayed manure and leaf soil. If a large clump is desired in the shortest possible time, plant the small live pieces in a circle, allowing a space of 2 feet between each portion. These will form a clump quickly, and may be thinned, if preferred, after a season or two. Burning the old foliage is often recommended, and should be done early in March: but in this particular case it would not be so beneficial as dividing. When burning is done it is assumed that the plants are in a normal, healthy condition: it is simply a method of dealing with the dead foliage. Another method is that of clipping the plants severely with a pair of hedging shears, just before new growth commences in the spring. If you decide to divide the plants, do the work forthwith. The clumps should be watered during dry weather in their first season, and the surrounding soil mulched with short grass (such as lawn mowings) or leaf soil, to conserve the soil moisture at the roots.

Parents of Hybrid Plants: *E. H. W.* When the parentage of a hybrid is given it is usual to place the name of the seed-bearing parent first and the pollen-bearing parent second. But this is not invariably the case, and to make the matter perfectly plain the signs ♂ (male) and ♀ (female) should be used.

Plants from Jamaica: *J. H.* The Board of Trade informs us that the Customs have received a general licence permitting the import of all articles on the list of prohibited imports, excepting gold, spirits (other than brandy and rum), and hops, when they are exported from and are the produce or manufacture of His Majesty's Dominions.

Standard Apple and Plum Trees: *E. H. W.* We recommend you to prune your recently planted four to five-year-old Apple and Plum trees immediately. In lifting the trees for transplantation the roots will receive a certain amount of check, and in addition to the need for regulating top and bottom growth, pruning is especially necessary in the case of standards to lay the foundation for well-balanced heads.

		—Cocos	24 0–36 0

REMARKS.—Business is now improving in this department and flowering plants are in good demand notwithstanding the high prices. Red, white and pink Stocks are on sale this week. Hydrangeas are also receiving much attention from buyers. Ferns and Palms are improving in quality, and a brisk trade in them is expected during the next fortnight.

Ferns and Palms: Average Wholesale Prices.

		— yellow... ...	5 0– 6 0
Narcissus ornatus per doz. blooms	8 0–12 0	Violets, single, per doz. bun. ...	3 0– 6 0

REMARKS.—The increased supplies most noticeable this morning were of Carnations and Roses: the newest arrivals of the latter are Mme. Abel Chatenay and Molly Sharman-Crawford. The blooms are excellent in size and colour, and are selling freely. In most other subjects the conditions are the same as last week. The advent of warmer weather will doubtless cause the prices of many coloured flowers to fall, but there is no anticipated drop in price of white flowers, owing to the demand this week for the Welsh festivals, whilst next week will see a further demand for Easter. A few boxes of Sweet Peas are being sent from Guernsey, also a few boxes of Darwin Tulips, but Daffodils and White Narcissus are the chief supplies.

REMARKS.—English Gros Colmar Grapes continue to be available and there are also Belgian and Almeria (Spanish) Grapes on sale. A consignment of Cape Fruit is due to arrive, including Grapes, Pears, and Melons, to be followed with a shipment of Oranges. Winter Nelis and Easter Beurré Pears are still obtainable. Morning gathered Strawberries are obtainable daily in half pound punnets. New Brazil Nuts are fairly plentiful. Supplies of Cucumbers are increasing daily, but Mushrooms are a short supply. The consignment of Dwarf Beans shows an increase. Seakale is a limited quantity. French vegetables on offer consist of the following: Asparagus, Globe Artichokes, Lettuce, Endive, Broad Beans, and Carrots. Rhubarb is a shorter supply. The commoner outdoor vegetables are still scarce.

THE WEATHER.

THE WEATHER IN SCOTLAND.

March was a cold month, with frequent night frost Snow fell on six days, and lay continuously for four days, from the 20th to the 23rd. There was a moderate amount of sunshine, fairly evenly distributed throughout the month. The rain gauge yielded a total of 1.70 inch, the greatest yield for one day being 0.55 inch for the 19th. There were eighteen days of precipitation and eleven official rain days. Of sunshine we had 110.7 hours, being an average of 3.6 hours and a percentage of 30.2. The brightest days were the 4th, 17th and 28th, with nine hours each. On six days there was no record. The barometer, with a mean of 29.78 inches, varied between a highest of 30.52 inches on the 16th and a lowest of 28.78 inches on the 27th. For the month the mean temperature was 35.5°, with a mean range of 13° and an absolute range of 30°. The highest maximum was 49° on the 2nd, and the lowest minimum was 19° on the 4th, while the lowest maximum and highest minimum were each 36°, on the 21st and 2nd respectively. The mean maximum was 42° and mean minimum 29°. On the grass a mean minimum of 25° was obtained, with a lowest of 14°, on the 4th. There were 25 nights of ground frost The relative humidity of the air was 79 per cent At one foot deep the soil temperature rose from 34° to 36°, and then fell to 35°. The prevailing winds were from the north and west, with a gale on the 26th-27th.—*James Malloch, Director of Studies, Training College, Kirkton-on-Mains, near Dundee.*

☛ For CONTENTS see page 187.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe, and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

TENDERS.

LONDON COUNTY COUNCIL.

SUPPLY OF STORES, ETC.

APPLICATIONS are invited from persons and firms, and particularly manufacturers, to have their names placed on the lists of persons and firms from whom the Council from time to time invites Tenders for the supply of

HORTICULTURAL GOODS, POLES, FERTILISERS.

In those cases in which Tenders are limited to Manufacturers or Producers, applications from Agents, Middlemen or Dealers will not be considered.

Applications must be made on the Official Form, copies of which, together with a statement giving further information on the subject, including the standard conditions of contract, can be obtained from the Clerk of the London County Council, County Hall, Spring Gardens, S.W.1.

Particular attention is drawn to the fact that when an application has been made to the Council by a person or firm for a place on the Council's List, and the application has been acceded to, it is not necessary for such person or firm to apply for Forms of Tender, as in all suitable cases Forms of Tender will be sent from time to time as issued.

JAMES BIRD,
Clerk of the London County Council.

PEACE!

WITH the near approach of the Peace Settlement the paper problem becomes less acute, and we are now in a position to accept more advertisements than hitherto. We shall be glad if our clients will send us their orders for a series NOW, in order that we may allocate the space. In order to prevent disappointment, those who wish for special positions will be well advised to secure them at once.

Please address all communications to;

SNOWDROPS.

THE various species of Galanthus or Snowdrop are widely distributed over Europe, and extend through Asia Minor to the Caucasus. The local forms or varieties seem to be numerous, and when plants are raised from seed it is by no means difficult to pick out seedlings which appear to some gardeners to deserve distinctive names. Others are content to know only the specific name of their plants, without giving a varietal name to each one that shows a slight variation, but, even so, they find it difficult to assign their Snowdrops to one or other of the various species. These notes have no claim to be exhaustive, but merely represent an attempt to point out the characteristics of the several species as they were defined in the original descriptions. The points of difference between the various species are in most cases slight, and it may well be that the evidence of seedlings would lead to the reduction of the number of species by showing that several so-called species were really of hybrid origin.

In our search for characteristics by which to separate the species, we may consider either the foliage or the flowers. The latter seem to vary considerably in collected and seedling forms, both in shape and also in the position and extent of the green markings which usually occur only on the inner segments, although forms are known in which the outer segments are also marked with green. The foliage is perhaps more constant in its characteristics; at any rate, it provides us with a guide by which to divide the species into three groups. The first of these has the narrow, almost flat glaucous leaves of G. nivalis; the second has bright green leaves; and the third has leaves with edges which are folded back longitudinally, especially at the base.

To the first of these groups belongs G. nivalis, which is the Snowdrop most commonly grown in our gardens, and which has even become naturalised in some places, though it is probably not a native of this country. In southern Europe there is a stronger growing ally of G. nivalis called G. caucasicus (cf. Baker, *Gard. Chron.*, 1887, March 5, page 313)) This is perhaps hardly more than a sub-species, in which the stronger growth is due to a more congenial climate. The outer segments of the flower are more convex, and narrow more noticeably at the base, and the plant sometimes has the habit, which I have never noticed in G. nivalis, of producing a second stem and flower from one pair of leaves. In the neighbourhood of Naples, and possibly also on the eastern side of the Adriatic, there grows another sub-species, which has been named G. Imperati (Bertoloni, *Flora Italica*, IV., 75). As was recently shown in these columns, there is perhaps some doubt as to whether the real G. Imperati is in cultivation, because the plant which goes by that name in our gardens flowers earlier than G. nivalis, although Bertoloni draws special attention to the fact that his plant is distinct from G. nivalis in its later flowering habit. The supposed G. Imperati of our gardens is a fine early-flowering form, obviously closely allied to G. nivalis.

In 1874, Mr. Elwes found, in the neighbourhood of Smyrna, a fine Snowdrop (see fig 85 B), which was named after him (G. Elwesii, Baker, in *Bot. Mag.* t. 6166). This has broader and even more glaucous leaves than those of G. nivalis, and the inner segments of the flowers have, besides the green dots or horse-shoe marks at the edge, a large green blotch on the lower part. Moreover, the inner surface of the inner segments is almost wholly covered by parallel, green veins to the number of twelve on each segment, while in G. nivalis there are on each segment only six complete lines and two lines that merely begin and then fade away. Another characteristic of G. Elwesii is the way in which the inner segments narrow suddenly just below their apex, thus forming a slight constriction in the tube containing the anthers which is formed by the inner segments.

The second group of Snowdrops—namely, those which have bright green leaves—comprises three species. The first of these—G. latifolius—was described as long ago as 1868 (Rupr. in *Regel's Gartenflora*, page 130 t. 378) as coming from the Alpine meadows of Ossetia, a district in the central Caucasus to the north of Tiflis. The leaves are broad and glossy, but the flower is disappointingly small and very similar to that of G. nivalis; that is to say, the inner segments have only the small horse-shoe green mark with its extremities extending into the notches at the apex and no green blotch on the lower part of the segments.

FIG. 85.—(A) GALANTHUS PLICATUS; (B) G. ELWESII.

In 1888, Foster received from the neighbourhood of Amasia, in Northern Asia Minor, a number of bulbs which proved to be those of a new species which was named after him by Baker, *Gard. Chron.*, 1889, April 13, page 459. G. Fosteri combines the characteristics of G. Elwesii and G. latifolius, for it has the green

IT IS THE STANDARD FOOD FOR PLANTS.

bridge and Mr. Lafferty. In the *Gard. Chron.* of March 29 (page 157) Mr. Wm. Taylor asks "If Phytophthora is the culprit, why should it not continue to the end when we know how much this fungus and its allies delight to flourish on the class of plant to which the Tomato belong?" Pethybridge and Lafferty account for the cessation of the rot just above the soil level as being perhaps due to changed conditions of moisture. *R.*

HARDY FUCHSIAS.

Signs are not wanting to show that the different hardy Fuchsias are increasing in popularity. This need occasion no surprise, as they form a delightful feature in the garden during the latter part of the summer, and often well into the autumn. In the favoured parts of the country, such as the south and west, and especially when in proximity to the sea, some of them form large bushes that will keep up a succession of flowers for months together. So well do they flourish at the seaside that there is a widespread idea that such conditions are necessary to their well doing. This is, however, by no means the case, as in gardens far removed from the sea they are very fine and much appreciated. One of the largest growers, and so desirable in many ways that it would be my selection if limited to a single one, is F. Riccartonii. This, which almost attains the dimensions of a small tree where it is favourably situated, is of a freely branched habit of growth, and bears its small but richly coloured blossoms in great profusion.

The different hardy Fuchsias may be grown in various ways. First, the smaller kinds are seen to considerable advantage when given suitable positions in the rock garden; next, where quite hardy the stronger growers may be associated with ordinary flowering shrubs. Even in colder districts many of them may be treated as herbaceous subjects, for if cut to the ground each season they will grow again from the base in the spring and flower freely during the latter part of the summer. When treated in this way they are seen to the best advantage grown in a bed or mass. This method admits of the crowns being covered in winter by a dressing of leaves or some other protective material.

For some years Mr. L. R. Russell, of Richmond, has made a speciality of hardy Fuchsias, and they used to form a feature at Messrs. J. Veitch and Sons' Coombe Wood Nursery, where a good collection of the best varieties was grown. Many of the hardy kinds, particularly such old favourites as F. globosa and F. gracilis, are now regarded as but varieties of the Chilian F. macrostemma, though they were formerly looked upon as distinct species. Established bushes of these two, as well as of F., Riccartonii may often be met with in cottage gardens.

An old, yet very distinct, hardy Fuchsia is known as F. corallina or F. exoniensis. In this plant the leaves are considerably larger than in any of the others, and, growing in the open ground, it forms a dense bush 3 to 4 feet in height, and of a distinct arching habit of growth. The flowers have red sepals and a purple corolla. Of varieties with white corollas, so freely represented among the greenhouse kinds, the hardiest is Madame Cornellison, which is also one of the oldest of this class, having been sent out about the year 1860. A large number of hardy Fuchsias were raised and distributed by M. Lemoine, of Nancy. The first were sent out in 1886, and others in following years. Chief among M. Lemoine's varieties are ; americana Elégant, Bouquet, Drame, Elysée, L'enfant Prodigue, Florian, and myrtifolia minos. They are exceedingly free flowering, but not so vigorous in growth as F., Riccartonii or F. gracilis.

Nurserymen who stock these Fuchsias generally keep them in pots. Where they can be obtained in this way I prefer to plant them out into their permanent quarters during the latter part of May or in June, as there is then ample time for them to become established before winter. *W. T.*

FORESTRY.

TIMBER OF THE FALSE ACACIA.

In 1823 Cobbett created quite a sensation with regard to the False Acacia (Robinia pseudacacia), the wood of which, under the name of the Locust, he declared to be "absolutely indestructible by the powers of the earth, air and water." He caused many millions of this plant to be reared from seed, which he distributed throughout the country and prophesied that the time was not far distant "when the Locust tree would be more common that the Oak." This, I need hardly say, has never come to pass, though some of the trees planted in Cobbett's time have attained a large size and produced timber of excellent quality.

At one of the largest toy-making establishments in London I saw several articles made of home-grown Acacia wood, for which purpose it seems to be well adapted. The timber produced in this country is of good quality—strong, moderately weighty, and very durable—and has stood the test of time in a commendable way.

Fig. 87.—Tomato seedling attacked by Phytophthora cryptogea.
(See p. 188.)

In fully matured trees it is of a peculiar greenish-white colour, changing to a dull buff or brown when quite dry, marked distinctly with brownish veins, and works smoothly under the tools of the carpenter. It forms heartwood when quite young, and the burred or knotted graining is rich and beautiful.

In this country it has not been extensively used, though experiments carried out on one of Lord Derby's properties proved that home-grown timber is valuable for many out-of-doors purposes, and has been used successfully for turnery and as nails for gates and wooden buildings. Some of the trees that were cut into boarding girthed 12 feet at a yard from ground-level. The timber requires slow and careful seasoning, or the boards are apt to warp and rot. On the Continent the timber is largely employed in the making of agricultural implements, also for carts, carriages, axles, posts, sills, joists and gates. But apart from its value in an economic sense, the Acacia and its varieties are among the most beautiful of flowering trees; while they succeed better than almost any others when subjected to the conditions of our larger centres of industry. *A. D. W.*

TREES AND SHRUBS.

FIG TREES IN LONDON.

A number of old and large Fig trees are to be seen in London, including the historic specimens at Lambeth Palace, the far-reaching tree at High Street, Poplar, those in St. Paul's Churchyard, and the soot-begrimed standard tree at St. Giles-in-the-Fields. Even in the densely populated East-End, as at Stepney and the Commercial Road, the Fig-tree looks healthy and has attained to goodly proportions, which points out how well suited this tree is for town planting. The first Fig trees planted in this country are said to have been brought from Italy in 1548 by Cardinal Pole and planted by him at Lambeth. When measured two hundred years afterwards these trees were 50 feet high, the circumference of the stems being 31½ inches and 25 inches respectively. In 1813, being much injured by frost, they were cut down, but sent out shoots freely. Loudon mentions that when he visited the grounds in 1836, owing to the structural repairs to the palace in 1829, both trees had been rooted out, the only remains being some young plants in the kitchen garden, which had been raised from cuttings of the original trees.

There are now five trees growing by the buttresses of the library, the largest of which when measured in 1917 was 30 feet in height, the stem girthing 33 inches. One of these was, unfortunately, blown partially over a short time since, and the stem split in consequence.

In Stepney Churchyard, now converted into a park, by the archway at Stepney Station, by Jamaica Road—all in the East End of London—the Fig flourishes. In the rectory garden at All Saints', Poplar, a healthy Fig-tree, some 20 ft. in height, may be seen from the street. By the lake side in St. James's Park are many healthy, far-spreading Fig-trees, while as a wall covering—as by the National Gallery and many other public buildings, the deep-green, stout leaves of the Fig have been found to be the most useful and lasting of foliage for smoky situations. Probably, the tallest of London Fig trees is that in Whitefriars, by Powel's glass works, which has attained to a height of fully 40 feet, the spread of branches being proportionate.

VEGETABLES.

DUTCH BROWN BEANS.

Now that the time of sowing vegetable seeds has come round again, it may interest some readers of *The Gardeners' Chronicle* to know how I fared on a small scale last summer in the North-West of England with the Dutch Brown Beans distributed to Fellows by the Royal Horticultural Society. I obtained one ounce of seed and raised about fifty plants under glass, but had only room for a row of thirty plants, which were put out of their pots on May 25th and spaced a foot apart. The pods were gathered in early October, shelled, and the beans weighed. The yield obtained was 2 lbs. 12 ozs. of mature and 5¼ ozs. of full-sized, immature beans. The average yield per plant works out roughly at 1⅞ ozs., approximately 80 beans. The row took up about as much room as one composed of Potatos would. Allowing the average low return of 2 lbs. of Potatos per plant, and calculating the nutritive value of the Bean as four times that of the Potato, the latter would then have afforded five times the quantity of food, with much less expenditure in labour; consequently in this part of England this variety of Haricot can scarcely be regarded as remunerative. The question remains, however, whether one can consider it worth growing in this climate.

Last summer was not favourable for such a sun-loving crop, for after the middle of July the weather here was cool and wet for the rest of the growing season, though the season was a long one. The first frost was not experienced until the night of the 12th-13th October.

I hope to try the Dutch Beans again this summer, from seed of my own saving, to see what may be the result should August and September prove more favourable. *J. P., Carlisle.*

markings of G. Elwesii near the base of the inner segments and the bright green foliage of G. latifolius.

The third species of this group is G. Ikariae (Baker in *Gard. Chron.*, 1893, April 29, p. 506), which was found on the island of Nikaria (Icaria), which lies to the south-west of Samos. This has the broad, glossy, bright-green leaves of G. Fosteri and large flowers with a single green blotch on each inner segment. It flowers later than Fosteri, and is indeed one of the latest of all Snowdrops to flower.

To the third of the three divisions, which we have made among the Snowdrops, there belongs perhaps only one species—namely, G. plicatus (see fig. 85 A) (Marschall von Bieberstein, *Flora taurico-caucasica* III., page 255, 1819). This was aptly named with reference to the curiously folded edge of the leaves. These are of a rather thin substance, especially towards the edge, which is folded back for some distance along either side from the base upwards. Even if the folds are not apparent in the upper part of the leaf, they can always be found by examining the base. The outer segments of the flowers of G. plicatus become very narrow near the base, and stand out widely from the inner segments, and, even as the flowers grow old, tend to reflex. The inner segments have a larger green blotch than those of G. nivalis, and have eight parallel green veins on the inner side of each segment. This Snowdrop seems only to have become known in our gardens after the Crimean War, when bulbs were brought home by soldiers who had seen it flowering during the war. It is found, apparently, in the Crimea and on the north-western shores of the Black Sea.

We have now passed in review all the chief species of Galanthus, but there remain others that have been described as species and of which some should probably rank as such, while others are possibly natural hybrids.

In Greece and the neighbourhood Snowdrops are found that flower in the autumn and which retain this habit even in this country, where the flowers appear in October, before the leaves. They are, however, difficult to keep in health in our gardens, and their exact place in the genus is still uncertain. G. octobrensis was found in Albania in 1875; G. Rachelae was discovered by Professor Mahaffy on Mount Hymettus in Attica in 1886 and G. Elsae on Mount Athos, while G. Olgae was described as flowering in October on Mount Taygetus, in Southern Greece.

G. cilicicus is probably only an early-flowering form of G. nivalis. When first imported the bulbs send up their flowers early in November, but in subsequent years the blooms do not usually appear before Christmas.

In the Balkans there are at least two Snowdrops, which, from the descriptions, would seem to be more nearly allied to G. Elwesii than to any others. Both have the green basal blotch and glaucous leaves of that species but differ slightly both from it and from each other in the shape of the inner segments. G. gracilis was described by Velenovsky (*Flora bulgarica*, p. 539, 1891), as flowering in March, near Sumla, or Choumla, in Bulgaria, while Orphanides' G. graecus is described in Boissier's *Flora orientalis* V. p. 145 (1884).

G. byzantinus, which is found in western Asia Minor, is intermediate, and probably a hybrid, between plicatus and Elwesii. Its foliage is relatively broad and has the longitudinally folded edge of plicatus, but it is of a more glaucous and lighter green. (See Baker in *Gard. Chron.*, 1893, Feb. 25, p. 226.) G. byzantinus is of easy growth and is liable to vary considerably both in its time of flowering, in the shape of its flowers and in the extent and position of the green markings on its inner segments.

Baker's G. grandiflorus (*Gard. Chron.*, 1893, March 25, p. 355 and June 3, p. 656) was apparently a hybrid between G. plicatus and some large flowering form of G. nivalis, while G. Allenii (Baker, ibid, 1891, March 7, p. 298) and G. Perryi (Baker, ibid, 1893, March 4, p. 258) appear to be two hybrids between G. latifolius and G. caucasicus, the latter being closer to G. caucasicus, while the former is more like G. latifolius. *W. R. Dykes.*

PHYTOPHTHORA DISEASE OF TOMATOS.

The Tomato is a plant which is subject to many serious diseases and pests, and growers will be more or less interested to learn that another disease must be added to an already too long list, and it is one which threatens to do great harm unless precautionary measures are taken. Recently I was called upon to visit a large Tomato-growing nursery in the South of England (where plants are raised by the tens of thousands for indoor and outdoor culture) to investigate some trouble which the grower was experiencing with his plants. I was taken into a large house where there were thousands of plants in 3-inch pots; a large percentage of the plants were falling over the sides of the pots, as shown in the illustration (fig. 86), and large gaps where diseased plants had been removed showed that the disease had brought about many fatalities. The grower informed me that every morning and afternoon he had to remove large numbers of "top heavy" plants which the previous day were quite upright and sturdy. He said there had been trouble with the disease for the past three years, but it was not until this spring that he had regarded it with any seriousness.

Microscopic examination of the plants revealed that the diseased areas at the collar of the plant were invaded by fungus mycelium, and when diseased plants were grown in bottles of water, sporangia were freely developed, and it was then possible to identify the fungus as Phytophthora cryptogea Pethyb. This fungus was first described in the Scientific Proceedings of the Royal Dublin Society, Vol. XV. (N.S.), No. 35, February, 1919, under the title of "A Disease of Tomato and other plants caused by a New Species of Phytophthora," by Dr. G. H. Pethybridge and Mr. H. A. Lafferty.

The symptoms are given in detail, and according to the authors the disease is usually first apparent when the affected plants have reached a height of six inches or so. The stem just above the ground becomes brown and shrivelled, and the plant becomes top heavy and falls over. It is interesting to note that the foliage remains quite green and healthy for some time after the plant has collapsed. A diseased plant taken from a pot generally shews that the affected areas continue below the soil level and the roots are also affected (fig. 87). Healthy roots are generally found nearer the surface of the soil, formed, no doubt, by the plant's efforts to overcome the effects of the disease. These adventitious roots in turn become affected and the plant finally dies.

Sometimes a species of Pythium is formed in conjunction with Phytophthora, but the authors clearly show that this is not the primary cause of the disease. Pure cultures of the organism were obtained in Quaker Oat agar, and healthy plants were inoculated with the fungus. At the end of 48 hours it was evident that infection had taken place, and within a week the inoculated plants had toppled over and the leaves began to turn yellow. The fungus was again isolated from these plants and grown in pure culture, and was found to be similar to that used for inoculation purposes.

The development of the fungus in pure culture is dealt with in detail, and the production of sexual organs described. The authors also found that the fungus is the cause of a disease of Petunia and Aster, although it is still doubtful if the fungus causing the black-leg disease in Asters is absolutely identical with Phytophthora cryptogea.

The authors are of the opinion that the plants become infected through their roots from the soil, and this conclusion is further strengthened by the fact that seeds sown in infected soil became diseased when they had reached the height of two inches. It was thought that the disease may be introduced into the soil by the leaf-mould, more particularly because the fungus was found to be pathogenic to Beech. This point is worthy of further investigation.

With regard to the control of the disease, popularly named "foot-rot," the authors think that the healthy portion of the plant could be treated as a cutting, but it is doubtful if this method would be popular with large growers. The precautionary measures recommended are: (1) Destruction of diseased plants by burning; (2) Removal from the nursery of all soil in which diseased plants have been growing; (3) Thorough cleansing and disinfection of houses, frames, pots, pans and boxes; and (4) Thorough sterilisation of the soil used for sowing, pricking off and potting. It is stated that partial sterilisation of soil by the methods of steaming employed in connection with other diseases of the Tomato would probably not be sufficient. The authors do not state the length of time which the soil should be heated nor the minimum temperature required.

In the issue of *The Gardeners' Chronicle* for March 22 (page 142) reference was made to "Damping-off and Collar Rot of Tomato." This disease was considered by Mr. G. T. Spinks to be caused by a species of Phytophthora, but he had not been able to find any sexual organs and was therefore unable to describe the species (c.f. The Annual Report of the Agricultural and Horticultural Research Station, Long Ashton, Bristol, 1917, pp. 25-27).

From the symptoms recorded by Mr. Spinks, it is very probable that this disease is the same as that now described in detail by Dr. Pethy-

Fig. 86.—Tomato seedling which has collapsed as a result of Phytophthora disease.

in blossom they should be protected from frost and cold winds, and especially in exposed situations. Cherry trees are often laden with blossom and it is necessary to severely thin the flowers as soon as they begin to unfold. If this is not done, it often happens that the fruit appears to set and then at stoning period most of it drops. Heavily blossomed trees should have more than half their blooms removed. Dusting the border lightly with lime, and afterwards watering it is beneficial to the trees after the fruit is set. Weak manure water should be given after the setting stage and at fortnightly intervals, but it should not be given when the fruit is stoning. Where manure water is not available use a mixture of superphosphate of lime 2 parts and 1 part muriate of potash, at the rate of one ounce to the square yard. For better spreading the fertiliser, mix a little dry sand with it and apply when the flowers begin to fade. Trees with heavy crops should be given a second dressing when the fruit is swelling.

THE ORCHID HOUSES.

By H. G. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Odontoglossum citrosmum. — Specimens of O. citrosmum which have been resting for a long time in the cool-intermediate house are now commencing to grow again, and flower-spikes will soon make their appearance from the centre of the new growths. Henceforth afford a little more water and suspend the plants from the roof in such a position as to display the flower-spikes to advantage.

Deciduous Dendrobiums.—Considering their value as garden Orchids, the deciduous Dendrobiums are not cultivated so extensively as they should be. It is not difficult to grow them successfully, provided a warm, moist house is available. Growths spring from the base of the stem-like pseudo-bulbs soon after the flowers are over, and before they commence to root on their own account any necessary repotting or top-dressing should receive attention. It is not advisable to disturb any plants that are well-established in sweet material, but a little of the surface compost may be carefully picked out and fresh added. Young, vigorous specimens requiring increased rooting space should be given a shift with as little root disturbance as possible. Use well-drained pots or pans of sufficient capacity to accommodate the plants for two years. Specimens that have become exhausted from over-flowering are best removed from their receptacles (shaking all the old material from their roots) and, after cutting away useless pseudo-bulbs, potted anew. These Dendrobiums require a rooting medium that will not readily decay and one possessing a larger capacity for free aëration than for holding moisture. Equal parts of Osmunda fibre, A.1. fibre and fresh Sphagnum-moss well broken and mixed together, with a liberal quantity of crushed crocks and charcoal, will provide a suitable compost. The potting should be done carefully and firmly, and the surface of the compost left just below the rim of the pot. Watering is an important detail in the cultivation of newly-potted plants during their early stages of growth. Only sufficient moisture should be given to keep the material just damp, as new growths are frequently lost at this stage through an excess of moisture. As the new growths develop and the roots ramify freely in the compost the amount of water should be increased gradually. During their growing season these Dendrobiums need plenty of heat and a moist, buoyant atmosphere. The sun should be allowed to shine on them for as long as possible in the day, excepting just as young growth commences, when shading is necessary. On bright days, frequent damping of the house is necessary, and overhead syringing will also be beneficial at such times, but this should be done early in the day in order that the foliage may become dry before night-time. All kinds of deciduous Dendrobiums are easily propagated by division and by laying the pseudo-bulbs on moss after cutting them into short lengths, each with one or more nodes. Apical growths proceeding from immature pseudo-bulbs are also suitable for propagating.

PLANTS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Coleus thyrsoideus.—Head back old plants of Coleus thyrsoideus and keep them rather dry at the roots for a time. After they have had a rest, place them in a warm house and frequently syringe them so that they may produce fresh growths suitable for cuttings, which, when inserted in small pots of light, sandy soil, will root freely in a propagating frame.

Primula.—Seeds of Primula sinensis, to produce winter flowering plants, should be sown now in shallow, well-drained pans filled with a mixture of finely sifted loam, leaf-mould and sand. Press the soil firmly in the pans, and before sowing the seed thoroughly soak it with water. Cover the seeds with fine sandy soil and germinate them in a warm house. Cover the pans with glass and paper until the seeds germinate. If the soil becomes dry before the seedlings appear, dip the pans to their rims in water. The perpetual flowering P. obconica and other half hardy Primulas may be propagated by division of the roots. Pot the portions singly into suitable-sized pots, place them in a close frame, shade from sunshine, and water the soil carefully until growth commences.

Carnation.—Tree Carnations ready for their final potting should, according to their strength, be potted into 6- or 7-inch pots, the soil being leaf-mould with sharp sand, lime rubble, soot, and a little concentrated plant fertiliser. Pot firmly, and place the plants in a house having a temperature of 55° to 60°. Give the roots a thorough watering after potting, and syringe the plants twice daily. An occasional fumigation is necessary to check insect pests. Younger stock should be encouraged to make healthy growth. Stop the plants to make well furnished specimens.

Chrysanthemum.—Plants that have filled their pots with roots, both those intended for large blooms and bush plants for decorative purposes, should be shifted into 6-inch pots. Pot firmly in soil consisting of three parts fresh loam and one part leaf-mould, enriched with manure from a spent mushroom bed and soot. Place the plants in a cold frame on a layer of coal ashes. Spray them daily, but take care not to keep the roots excessively wet until the plants are growing freely. If subject to black fly, dust the leaves with tobacco powder. Pinch out the points of leading growths on bush plants to cause side shoots to develop.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Winter Greens: Cauliflowers and Broccoli.—Sowings of many of the winter green crops may now be made in an open position, and in ground that contains no fresh manure. Give the surface soil a good dressing of burnt garden refuse before sowing. Sow in drills one foot apart and an inch in depth. Protect the seed beds from birds.

Lettuce.—The box-raised plants should be ready for planting out. Place them one foot apart in a sheltered position. Make a sowing of both Cabbage and Cos varieties in open quarters.

Onions.—Onions raised in boxes early in the year will soon be ready for planting out of doors, provided they are well hardened. The soil should be loosened with a fork to bring the surface into a fine tilth, and a dressing of soot and burnt garden refuse applied. Tread the plot firmly and rake the surface level. Lift the Onions very carefully with a ball of earth and plant them firmly in rows 18 inches apart and allow 14 inches between the plants. If dry weather prevails at the time of planting water the seedlings directly they are set. Hoeing the soil frequently and occasional dustings of soot are very beneficial to this crop.

Peas.—Seedling Peas of main crop, marrowfat varieties that were raised in boxes, are ready for planting out of doors. Plant in double lines at eight inches apart in ground that has been trenched and manured. Water the plants if needed, and place stakes along the rows as they are planted. The rows of tall growing varieties should be at least six feet apart. Sow more seeds for successional cropping in drills running north and south.

French Beans.—As frames utilised for the growing of salad plants become vacant, sow seeds of Magnum Bonum and Canadian Wonder Beans in rows made 18 inches apart. Thin the plants later to 9 inches apart in the rows. Close the frame to favour a quick growth.

Cardoon.—Sow seeds of Cardoons singly in small pots and germinate them in gentle warmth. Afterwards harden them gradually in a cold frame. During the middle of May they may be planted in trenches prepared as for Celery, at 18 inches apart in single lines.

Marrows.—Sow a plentiful supply of all varieties of Marrows. It is best to sow only one seed in each 60-sized pot. Place the pots containing the seeds in a warm place until the seedlings appear, when some may be planted in frames on a spent hot-bed. Attend carefully to early Marrows growing in houses. Keep them well supplied with water and syringe the foliage regularly to promote quick growth. Pollinate the flowers and stop the leading growths.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to Major J. A. Berners, Woolverstone Park Gardens, Ipswich.

Strawberries.—The fruits on the earliest batch of plants will be ready to gather, and during the ripening period the atmosphere of the house should be kept dry, air being freely admitted whenever the weather is favourable. The amount of water supplied to the roots should be curtailed, as overwatering at this period will seriously affect the flavour of the fruits. Fruits on the successional plants should be encouraged by frequent applications of weak liquid manure, soot-water, or a suitable artificial manure, to the roots.

Pot Vines.—The fruit on pot vines will now be rapidly colouring and the berries finishing. A moderately dry atmosphere should be maintained and plenty of air admitted to the vinery during the day. Admit a little air also during the night, and increase the amount of ventilation early in the morning as the sun gains power. Watering requires to be done with extra care at this stage. The berries of the Black Hamburgh variety, after colouring has commenced, should rapidly assume the bluish black hue which denotes perfect finish and flavour. Berries that take a considerable time to colour are usually deficient in these respects. In such cases an application of sulphate of ammonia has often a good effect. This stimulant, however, is rapid in action, and should be used carefully or more harm than good will result. About half an ounce to one gallon of water, applied at intervals of eight to ten days, is sufficient to give good colour to both foliage and berries. The temperature at night should be about 65°, allowing 10° rise on dull days. On sunny days the temperature may be allowed to rise to 80° or more with plenty of ventilation.

Early Permanent Vines.—The berries of early Grapes have passed the stoning age and are swelling rapidly. They will shortly commence to colour. Growth will again become active, and to prevent crowding of the foliage pay timely attention to pinching and stopping the lateral growths. If there are signs of red spider, sponge the leaves carefully with a suitable insecticide. Examine the borders for the purpose of determining whether water is required: if it is now is a good time to apply a suitable artificial manure before giving a copious watering. Soot water has a beneficial effect, promoting good colour in both foliage and berries. Houses situated to catch the sun's rays early in the morning, and more particularly old houses, should have a little air admitted by the top ventilators throughout the night. Increase the amount a little early in the morning, and maintain the requisite temperature by the use of the hot water system. If this is done there will be very little danger of the berries scalding.

SOLDANELLA.

The genus Soldanella consists of only four species, a well-marked variety in the Transylvanian pyrolaefolia, and two natural hybrids. These plants are all peculiar to the mountain regions of the middle and south of Europe. The four species fall naturally into two groups, the distinctive character being in the length of the style. In the alpina and montana group the style is either of equal length to the corolla or longer, while in the pusilla and minima set the style is shorter than the corolla. Another distinction is that in the former two species the flower stems bear two or more flowers, while in the others the flowers are solitary.

All the Soldanellas may be grown in well-drained, moist soil, and they need plenty of sunshine. They do not flower well in the drier parts of this country, because a moisture-laden atmosphere is essential to their successful culture. Sphagnum-moss mixed with the soil in which they are planted has proved of great assistance in supplying these conditions. All are easily propagated by division of the roots after flowering, or from seeds sown in the spring.

S. alpina. This species is found throughout the alpine regions of Central and Southern Europe, at an elevation of from 4,000ft. to 8,000ft. It is distinguished by its reniform, entire leaves, very sparsely toothed, with two drooping lobes at the base. The stems grow to a height of 3 inches or more, and bear two or three fringed, violet coloured, drooping flowers in April and May. There is a beautiful white flowered variety of this plant in cultivation.

S. montana (see fig. 88). This species is found in the Alps of Austria and Transylvania at an elevation of from 3,000ft. to 4,000ft. It is a stronger growing plant than S. alpina, with rounded, more or less crenate leaves, which are often purple on the underside. The flower stems frequently grow to a height of from 8 inches to 12 inches, and bear two or three deeply fringed, violet-blue flowers in May and June.

S. pusilla (syn S. Clusii). This plant is found wild on the Granitic Alps of Central Europe at an elevation of from 5,000ft. to 7,000ft. It is a very small plant with minute reniform leaves, that are slightly crenate. The stems are about 3 inches high, and bear solitary, reddish-violet flowers. These are narrow, long, and fringed for nearly one-third of their length.

Fig. 88.—Soldanella montana; flowers violet-blue.

S. minima. This, the smallest of the Soldanellas, is found on the limestone Alps of Eastern Switzerland, Tyrol, and the Carpathians, at an elevation of from 6,000ft. to 7,000ft. The leaves are quite round, very small and not indented at the base as in S. pusilla. The stems are about 3 inches high, slightly downy, and bear solitary flowers of a lilac shade. In S. minima the flower is fringed to only one-quarter of its length. There is a white form of this species.

Of the hybrid Soldanellas S. Ganderi is intermediate between S. alpina and S. minima, but more closely allied to the former. S. hybrida is intermediate between S. alpina and S. pusilla. S. pyrolaefolia is a form of S. alpina with orbicular leaves and tall flower stems. *W. I.*

The Week's Work.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford, Wrotham Park, Barnet, Hertfordshire.

Aster, Stock and Zinnia.—Sow seed of these annuals in well drained pans or shallow boxes filled with a sweet, sandy compost pressed rather firm. Sow the seeds evenly and not too thickly, press them into the soil and cover them with fine, sandy soil. Give a gentle watering, stand the pans in a little warmth and cover them with squares of glass and paper until the seedlings appear, when both paper and glass may be gradually removed.

Hardy Annuals.—If the sowing of hardy annuals has been delayed the seeds should be sown forthwith in groups in well prepared soil. Do not bury the seeds too deeply. Seedling coming through the soil should be carefully protected from both slugs and sparrows.

Perennials.—Border Phloxes and other hardy perennials planted late need careful attention until they become thoroughly established. Water the roots at short intervals in dry weather, and watch for slugs and other pests. Use the hoe freely, especially amongst plants growing in soils inclined to cake on the surface in dry weather. Mulch the roots of all strong gross-growing plants freely, and thin the shoots so that those left to bloom may produce better and larger flowers. Support the plants at an early stage of growth.

Dahlia.—If old Dahlia stools have not yet been taken from their winter quarters set them out in cold frames on a layer of decayed leaves. Place them rather closely together and scatter fine soil and leaf-mould amongst the roots. Give the clumps a gentle watering and keep the frames rather close and moist till the young shoots appear, when more air should be admitted. Dahlias require a deeply worked soil and one that is thoroughly enriched with manure. The plants should be ready for putting out by the end of May.

Bedding Plants.—All bedding plants raised either from cuttings or seeds should be given careful attention. Do not allow the plants to remain a day longer than is necessary either in the cutting boxes or seed pans.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Watering Fruit Trees.—Fruit trees should be examined constantly to see they do not suffer from lack of water. Fruit trees, and especially those growing against warm walls, need an abundance of water, and a proper system of watering should be carried out. Where water is available from pipes, and a hose can be used, it is an easy matter to spray the trees, and this will afford water to the roots at the same time. In the early part of the year spraying counteracts the bad effects of cold winds. Where water is not laid on, a garden engine should be used for spraying. After the third week in May it is best to water in the afternoons or evenings, the latter time being best, as the water then has time to soak through the soil before the hot sun reaches the border. Where watering and syringing are done systematically and constantly, the trees are seldom attacked by red spider, and many other insect pests are kept away.

Cherry Trees Dropping their Fruit.—This trouble often arises from unsuitable conditions at the roots, and also from the bloom being damaged by frost and cold winds. It may be that the roots have got down into the cold subsoil, or that the drainage is not efficient, and if this is found to be the cause it should be remedied in the autumn. When the trees are

situated reasonably near to markets, with moderately good transport facilities. The organisers of the Government's schemes, we are assured, are keeping all these points well in mind. A second type of settlement is intended for the returning service man who has had little actual experience of agriculture, although he may have worked an allotment in town or suburb, and who wishes in future to obtain open-air employment in the country. For this man it is proposed to provide a cottage holding. The local authority will erect a cottage, attached to which will be a small area of land varying from half an acre to four or five acres. This little holding the man will be able to cultivate in part or whole for himself; he will be able to keep a cow or other livestock. But it is assumed that he will get the main part of his livelihood by working in some agricultural employment. No doubt later on, as they gain experience, some of these men will desire to pass from Class II. into Class I. At present they recognise that they might not be able to make a living if they set up as small holders on orthodox lines. Thirdly, there is another type of settlement. The Board of Agriculture have acquired several large estates which are being developed on co-operative lines, either as small holdings colonies, or as large farms on a profit-sharing basis. In the former case there will be a central farm in charge of an experienced agriculturist and grouped round it will be a number of small holdings of various sizes, each provided with a house and the necessary farm buildings. These holdings will be let to ex-service men after they have served a period of probation as wage-earners. The tenants will be able to obtain advice and assistance from the manager of the central farm; they will be able to hire horses and the more expensive farm implements, and will get the benefit of co-operative organisation for the purchase of their requirements and the sale of their produce. On the profit-sharing farms the settlers will each have a good cottage and garden, will be employed on the farm at the district rate of wage, and will also share in any profits made on the farm as a whole.

Heart Rot of Western Hemlock.—The demand for timber and the curtailment of ordinary sources of supply have caused of recent years a large demand for the wood of Tsuga heterophylla, the Western Hemlock, of which 248 million feet were cut in the United States in 1910. Unfortunately the value of the timber is affected adversely by the fact that it is very susceptible to decay. Recent investigations* show that the chief pest of decay is the Hydnaceous fungus Echinodontium tictorium. This fungus is a wound parasite which affects not only this species of Tsuga but also T. mertensiana and various species of Abies, such as A. grandis, A. concolor, A. nobilis, and A. amabilis. The fact is that the Western Hemlock, though it flourishes best in regions of relatively high rainfall, is very tolerant of environmental conditions, and is to be found growing in most undrained soils. In its growing state it contains in its wood a high percentage of water, and offers very favourable conditions to the entry of the parasite. Hence there can be little hope of preventing the disease, and the forester's efforts must be concentrated upon the control of the disease. Ordinary ringing of diseased trees is not efficacious, since owing to the large amount of water contained in the wood a tree which has been completely ringed so that a girdle of bark and some wood have been removed may continue to give and provide harbourage for the fungus for several years. Therefore the authors recommend the systematic destruction by fire of all individual trees affected by the fungus. An interesting fact referred to by the authors has reference to the use of the fungus by North American Indians: mixed with tar or oil the powdered fructifications of Echinodontium tinctorium were used for the preparation of the Indians' "war-paint."

Narcissus White Knight.—The standard of excellence which governs an award made to Daffodils by the Royal Horticultural Society's Narcissus and Tulip Committee is now so high that rarely does a variety obtain the coveted First-Class Certificate. This honour was granted, however, on the 8th inst. to the beautiful Narcissus White Knight, a Trumpet variety which has excellence of form, distinction, substance and purity to recommend it, and if it has one failing this is found in the comparative shortness of the flower stems. The illustration (fig. 89) shows the shape and pose of the flower, and the bloom shown in profile admirably depicts the regular, rolled rim of the trumpet—a marked feature. Narcissus White Knight was granted an Award of Merit on May 2, 1916, when shown, as on the 8th inst., by Messrs. R. H. Bath, Ltd., consequently it holds the double honour. In 1916 it was also exhibited in splendid condition at the Midland Daffodil show by several competitors. When White Knight and other white trumpet Daffodils are sufficiently numerous and cheap to be planted in quantity, their flowers should be popular with florists.

Precautions Against Caterpillars. — Fruit growers should keep a sharp look-out for leaf-eating caterpillars in the flower trusses of their fruit trees as the buds begin to open. In most districts last year great damage was done to fruit by the ravages of caterpillars both at this stage and later in the year. There is every prospect of severe attacks during the coming season; for where grease-banding was carried out in the autumn large numbers of Winter Moth were caught. Early preventive measures should be taken. A first spraying should be given before the blossom opens. The caterpillars are then very small and easily killed. If nothing is done at this stage, many flower trusses will be badly damaged. Severe or even total loss of crop may result, and finally partial or complete defoliation of the trees and a reduction of the crop in the following year may occur. The best spray to use at this time, according to a Board of Agriculture expert, is a nicotine and soap wash, which will destroy Apple Sucker and Aphis at the same time as caterpillars. The formula for nicotine and soap wash is:—Nicotine (95 per cent. purity), ¾ oz.; soft soap, ½ lb.; water, 10 gallons. If the water is hard, 1 lb. of soap should be used. Dissolve the soap in hot water, dilute with cold water to the required strength, add the nicotine and stir well. This is a "contact insecticide"; and it should be applied with as much force as possible and in a fairly coarse spray. There are many good proprietary washes containing nicotine which may be used in substitution. If spraying is delayed until after the blossom has fallen, arsenate of lead should be used at the rate of ½ lb. of arsenate of lead paste to 10 gallons of water. This should be applied in a fine spray, the object being to wet all the leaves without drenching them. No spraying should be done while the trees are actually in blossom. Both the above mentioned sprays are poisonous. Lead arsenate should not be used where vegetables are grown underneath the fruit trees, or

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *the two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 48.6°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Tuesday, April 15,* 10 a.m.: Bar., 28.8; temp., 49°. Weather—Showery.

Disease Resistance in Plants. The facts of immunity from disease are as remarkable as they are obscure. That plants should, by virtue of excellence of cultivation and their consequent robustness, be able to resist attacks of disease seems simple and self-evident; but that races of a given species of plants should exist which, whilst other races of no less vigour succumb to attack by a specific disease, are able completely to withstand that attack, could perhaps hardly merit belief were not the evidence overwhelmingly convincing. This latter type of specific immunity occurs in the case of Wheat and rust disease, in that of Wichuraiana Roses and mildew, Potatos and wart disease, as well as in not a few others.

So far as we are aware, nothing whatever is known of the nature of the power which confers specific resistance to disease. In the case of Wheat resistant to rust, it has been found that whereas the rust spore may germinate on the leaf and its germ tube may pass through a stoma, the tube, instead of gaining entrance to the cells, as it does when it infects a non-resistant race, withers away before the cells of the immune variety. It is evidently not passively but actively repelled. Another remarkable fact is that the hybrid between a rust-resistant and a rust-susceptible variety of Wheat is susceptible. On current methods of interpretation of the facts of inheritance this is taken to mean that susceptibility is due to the presence of a factor facilitating infection, and immunity is due to the absence of that factor. Recent discoveries with respect to immunity of animals from certain bacterial diseases (tetanus, etc.) may perhaps provide a clue to the understanding of these facts. It appears, according to these discoveries, that whereas a culture of the disease-producing bacteria, if washed clean of their toxins, are incapable of producing the disease with which their presence is generally associated, yet if, together with the bacteria, ionisable calcium salts are injected into an animal the disease is induced. The calcium salts cause the resistance of the cells of the body to be broken down and allow the bacteria to win in the struggle with the body cells. May it not prove that a similar explanation will be found to account for susceptibility of plants to specific disease? That the explanation might be found to lie in this direction is evident enough. Many of the differences between varieties of plants must depend on differences in the permeability of the protoplasmic linings of their cells. Colour varieties, for example, are probably to be explained in terms of protoplasmic permeability. Thus it is known that in the presence of a potassium salt a violet becomes converted into a blue pigment, and that in the presence of plant acids the blue becomes red. In races, varieties of which are each definitely characterised by one of these colours, it cannot but be believed that all contain the same pigment, all have potassium salts, and all possess plant acids. The reason for the varietal colour difference, must therefore be sought in the prohibition of movement of these things towards one another; where the permeability of the protoplasmic cell-wall admits of their commingling one colour results; where it prevents the interaction of these substances the variety is characterised by flowers of another colour. So in the case of immunity, may it not be that the infecting germ tube excretes a substance necessary for breaking down resistance—just as the fungus Botrytis cinerea is known to excrete oxalic acid! If this substance, the precursor and necessary antecedent of infection, can pass into the cell, the way is prepared for the entry of the fungus itself; but if not the latter beats in vain against the bars of impermeability.

Or it may be, and in the light of the researches already referred to it is by no means improbable, that the breaking down of the resistance is not brought about directly by some substance excreted by the fungus, but by a product of the action of the excretion on the substances in cell-wall. If the latter contain the necessary chemicals which, when acted on by an excretion from the fungus yield a toxin which passes into the cell and overcomes its resistance to infection, the variety will be a susceptible one; but if these chemical accomplices of infection are absent from the cell-wall, the variety remains resistant.

In any event, the work which is being done in enquiring into the mechanism of immunity in animals should encourage plant pathologists to undertake with renewed vigour the problem of plant immunity, for both from the point of view of pure science and of practical horticulture knowledge of the nature of the resistance of plants to disease is urgently needed.

Royal Horticultural Society's War Relief Fund.—A floral fête and exhibition in aid of the Royal Horticultural War Relief Fund will be held in the grounds attached to the Royal Hospital, Chelsea, on June 24, 25 and 26, 1919. Full particulars will be issued in due course. All inquiries (enclosing stamped envelope) should be addressed to 17, Victoria Street, S.W.1 (not to Vincent Square). Offers of exhibits and assistance in connection with the fête will be gladly welcomed by the committee, and should be addressed to the Hon. Treasurer, Sir Harry J. Veitch, R.H.S. War Relief Fund, 17, Victoria Street, S.W.1, or to Mr. Bisset at the same address.

Flower Show in Aid of St. Dunstan's Fund.—A flower show in aid of the Blinded Soldiers' and Sailors' After-Care Fund will be held in the Royal Hospital Gardens, Chelsea, on July 2 and 3, 1919. The Secretary of the show, Mr. T. Geoffrey W. Henslow, appeals for the support of the horticultural trade to make the exhibition a success.

Organising the Village.—At the latest meeting of the Agricultural Club, Sir Henry Rew, K.C.B., in the chair, the subject of discussion was "The Organisation of the Village," introduced by Sir Douglas Newton, K.B.E. Referring to the Land Settlement (Facilities) Bill, Sir Douglas said it provided, with perhaps some comparatively small amendments, the necessary machinery and facilities for the reconstruction of the villages, and the development of social life and amenities in the rural districts which were so much to be desired. The plan outlined by the Agricultural Policy Sub-Committee could be adopted, possibly with some modifications, if the necessary powers were given to local authorities, as well as to the central authority. There were primary essentials, such as decent houses, gardens, proper sanitation, and milk supply, which must be provided in every village where they were lacking or defective, and there were other scarcely less necessary provisions, such as those centres of social activity which the Village Clubs Association had been established to promote.

Changes at Madresfield Court.—Mr. William Crump is leaving Madresfield Court at midsummer, after a period of about forty years' service in these famous gardens. Mr. Crump has for long occupied a position in the front rank of British gardeners, and he is one of the most successful fruit growers in this country. He will be succeeded by Mr. Lambert, who has been in charge of Copley Hall Gardens, Howick, for the past fourteen years. Mr. and Mrs. Lambert recently received presentations from the members of the garden staff at Copley Hall and their friends in the district as an expression of esteem. The presentations were made by the rector, the Rev. Thomas Mitchell, who referred to the many activities of Mr. Lambert in Howick, including his association with the Church, Howick Cricket Club, and the local Rifle Club.

Guides to Smallholders.—The Board of Agriculture has in preparation a series of "Guides to Smallholders." Although primarily intended for free distribution through the Army authorities to service men contemplating settlement on the land, the guides will be available to the general public. The first number, dealing with "Pig Keeping," is ready, and copies may be obtained from the Board's office, 3, St. James's Square, London, S.W.1, price 2d. each, post free. Other guides which will be issued shortly are: "The Smallholder's Horse," "Farm Crops," "Co-operation for Small Producers," "Soils and Manures," Fruit Growing on Small Holdings in England and Wales," and "Market Garden Crops on Small Holdings."

State-Aided Land Settlement.—In view of the misconception that appears to prevail in some quarters as to the Government's plans for placing ex-service men on the land, the Board of Agriculture has issued a brief statement of the three different types of settlement which are in progress of organisation. The first is intended to meet the requirements of the considerable number of men who, before they served in the Army, worked on the land, who have a certain amount of capital at hand, and who desire a small holding of their own. Either through the County Council or the Board of Agriculture it is proposed that these men should be given the opportunity of leasing or buying small areas of land which they can cultivate for themselves. There are already many more holdings of this kind in England and Wales than is commonly supposed; and most of them are extremely successful. Much depends, of course, on the holding being on good soil and

the soil. In the early part of the year this is secured by diligent attention to hoeing, but later in the season it may often appear advisable to apply a deep mulching to both sides of the rows, and occasionally resource must be had to watering. Soft water, or that which has been exposed to the air for some time, only must be used, as hard, cold water arrests plant growth, and in the case of Peas renders them open to attacks of mildew. Against this disease preventive measures should be adopted in the case of mid-season and late crops, and the most effective preparation is that known as Mo-Effic, used according to the directions supplied with it, and it is easily applied by means of a fine spray from a knapsack sprayer, choosing the late afternoon for this work.

One would scarcely anticipate much trouble from the actual operation of seed sowing, but as each season discloses complaints of bad germination, one naturally inquires if the fault lies entirely in the seed, which is often condemned without just reason. For some years I have practised starting the earliest sowings in pots, the varieties mainly depended upon being The Pilot, The Sherwood, and Chelsea Gem. Pots about 4 inches in diameter are used and filled with ordinary potting compost, placing 6 to 7 seeds in each and covering them with rather less than an inch of soil, 75 pots constituting a sowing. The pots are placed under the stage of an ordinary greenhouse, away from hot-water pipes, and from seed ripened in a normal year the germinating power given by this system was never under 98 per cent.; in seed ripened in a bad year the result equalled 92 per cent. Seed from the same samples was invariably used for the first sowing out-of-doors, and the results were extremely interesting, though sometimes disappointing.

Provided the soil worked free, and with a good time to sow in, germination, in the case of the "Pilot," gave about 90 per cent.; Chelsea Gem and Sherwood, sown later on the same plot, gave about 85 per cent. In spring, 1910, seed of Chelsea Gem gave most erratic results. Sown in pots the percentage of seed germinating was over 95 per cent.; from the earliest sowing in the open, made about the middle of April, scarcely 50 per cent. of the seed sown germinated; while the last of the sample, sown in June, on ground vacated by Celery, gave a yield of almost 100 per cent.

Results such as these clearly indicate no fault on the part of seed, but are entirely traceable to unsuitable conditions or temperature of the soil. In the case of late varieties similar results have been noted on soil fresh dug before sowing, for however carefully prepared it is quite impossible on some lands to secure the fine tilth such as naturally follows where land is exposed to the weather for a prolonged period, and which in the ordinary course provides an ideal seed-bed. Bad husbandry, low temperature in the soil, and unfavourable weather are factors always opposed to the highest results in seed-sowing, and to these we may often trace the majority of the complaints relative to bad germination of seed. *Thomas Smith.*

QUERCUS COCCIFERA.

THE KERMES OAK.

As part of the general interest which is now being taken in hardy trees and shrubs, it is to be hoped that there may be included a renewal of the cultivation of Oaks. Fifty years ago the nurserymen of the time, or, at any rate, some of them, maintained quite extensive collections for sale. Now it is becoming difficult to get any but the commoner sorts and those with coloured or variegated foliage. There is a very extensive collection available for study at Kew, and a few amateurs—notable amongst them being Lord Ducie and the Hon. Vicary Gibbs—have maintained a keen interest in the genus.

One of the most interesting of the evergreen species is Quercus coccifera, a shrub or small tree of close compact habit. It has not, of course, any colour beauty of flower to recommend it, but its wealth of small leaves and its neat habit, together with its historical associations, make it a pleasant acquisition as a lawn shrub. The leaves are stiff, hard of texture, smooth, glossy on both surfaces, broadly oval, round or oblong in outline, and armed with a few stiff, spiny teeth at the margins; they range from ½ to 1½ inches in length, but not so much in width. The species produces acorns fairly regularly in this country. The illustration in Fig. 90 shows a fruiting branch taken from a bush at Kew. The acorns vary much in shape and size, but are usually about ½ inch long, with the lower half enclosed in a cup, which is densely covered with short, spine-like scales. Examples of this Oak at Kew range from 6 ft. to 10 feet high, but there is one in the Vicarage Garden at Bitton approaching 20 feet in height.

Quercus coccifera is of economic interest, and gets its popular name of "Kermes Oak" from being the host plant of the insect, Chermes (or Coccus) ilicis. This insect when dried yields one of the richest and most permanent of red dyes—a dye, however, which has now, owing to the greater cheapness of other dyes, fallen very much into disuse. In the dried state the insect is known as "grain" or "scarlet grain," and from that this Oak has been known as the "Grain Tree." So highly was "grain" esteemed as a dye in mediaeval times that a representation of three sprigs of this Oak was taken to form the crest of the Worshipful Company of Dyers, whose arms were granted to them between 1420 and 1450 A.D. But so lost to modern industry had it become that the Company itself a few years ago no longer knew what the three sprigs were supposed to represent. Tapestries two centuries old in Flanders are said to have lost none of their richness of hue, so "fast" is this dye. Shakespeare knew its virtues well, and several times alludes to it; thus Olivia, in "Twelfth Night," says "'Tis in grain, sir, 'twill endure wind and weather." The Kermes was regarded by some of the early naturalists as the fruit of the tree upon which it was found, and by others as a vegetable excrescence similar in its nature to a gall.

This Oak is a native chiefly of the Mediterranean Region, extending from Spain and North Africa eastwards to Asia Minor and Syria. There are two or three forms of it, and in Palestine it becomes a fair-sized tree. *W. J. Bean.*

Fig 90.—FRUITING BRANCH OF QUERCUS COCCIFERA.

on Gooseberry bushes if the fruit is to be picked green. Where nicotine is used, a fortnight should elapse before the crops are gathered.

Retirement of Mr. James Hudson, V.M.H.—The retirement of Mr. James Hudson from the charge of Gunnersbury House Gardens, to which we referred briefly in last week's issue, takes effect at the end of May. Mr. Hudson has for a long period occupied a unique position in the world of horticulture, and the following account of his career will be read with interest. He was born on May 29, 1846, the youngest son of Samuel Hudson, who for forty-six years was head gardener and resident agent at Horsted Place, Sussex. James was educated at Doctor Saunder's grammar school at Uckfield, and became head scholar. In 1861 he entered upon a course of training in land surveying, timber measuring and general estate work. He had the opportunity of entering a solicitor's office at Lewes, but he preferred gardening to the law and after working under his father for some time he was appointed foreman at Deepdene, Dorking. In 1869 he sat for the R.H.S. examination and came out at the top (see *Gard. Chron.*, September 4, 1869, p. 940. "This is the only instance in which the whole number of marks has been obtained by any candidate since the commencement of these examinations.") His first position as head gardener was with Mr. J. C. im Thurn, at Champion Hill, and from thence he went to Gunnersbury House, in July, 1876, as head gardener to the late Mr. H. J. Atkinson, the then owner. After thirteen years in that position he was engaged by the late Mr. Leopold de Rothschild, who purchased the estate, and, being a keen gardener, gave Mr. Hudson every opportunity for the expression of his genius. Mr. Hudson has made his mark in all branches of gardening, but has excelled especially in the cultivation of indoor and hardy fruits, Water Lilies, Bamboos, and specimen plants. During his stay at Gunnersbury Mr. Hudson has frequently spent his holidays on the Continent, and has even gone so far afield as Palestine and Egypt, and in these countries, as at home, he has invariably acquired new horticultural knowledge during his travels. On four separate occasions he has judged at the Quinquennial Shows at Ghent; he has also acted as judge at Hamburg, Bruges, and in most of the principal cities of his native land. It is a matter of interest that one who headed the list in the R.H.S. examination of nearly fifty years ago should now be one of the Society's examiners, a position he has held since 1904. Further evidence of the high esteem in which he is held may be gathered from the facts that he has been a member of the Royal Horticultural Society's Council for about twenty years; was awarded the Victoria Medal of Honour in Horticulture when it was first instituted; was treasurer of the United Horticultural Benefit and Provident Society for twenty-five years; and has been more than twenty years a member of the Committee of the Gardeners' Royal Benevolent Institution. Everyone who visited the gardens at Gunnersbury House realised that an exceptionally clever cultivator was responsible for the splendid plants, flowers, fruits, and vegetables met with on all sides. To those anxious to know, Mr. Hudson has been always ready to give the benefit of his experience, and he wrote frequently in the horticultural Press on the methods that he employed; indeed, his writings in the *Gardeners' Chronicle* date back for a very long period. In the early 'eighties he wrote the weekly notes on Plants Under Glass in this publication for four years in succession, and since then he has contributed many times to our Week's Work columns, in addition to many original articles. Mr. Hudson, who is seventy-three years of age retires after a long, useful, and honourable career, with the best of good wishes and the generous regard of his employers. He will take with him into his retirement the good wishes of all who knew him either personally or through his writings. Those who frequent the meetings of the Royal Horticultural Society will be glad to know that Mr. Hudson will continue to reside at Acton and take part in the work of the premier horticultural society, with which he has been identified for so long a time.

THE ALPINE GARDEN.

MAZUS PUMILIO.

Among the many attractive, though often deceptively coloured, plates in Wooster's *Alpine Plants*, one of Mazus pumilio is certain to interest lovers of Alpine plants. The illustration is a fairly faithful one of this little member of the Figwort family. The species hails from Tasmania, and, like several other Alpines from the same region, is not so easy to retain in gardens as its "book" reputation would indicate. It is a neat little creeping plant only some two or three inches high when in flower. The almost entire and obtuse leaves incline to lie close to the ground, and among them rise on short stems, little above the foliage, the small, pale purple or violet flowers with white centres, which make this plant attractive though by no means brilliant.

As already suggested, though M. pumilio is reputedly hardy, it may be lost in some severe winters, and it is safer to keep a spare plant or two under glass to replace losses. It is an ideal subject for the Alpine house.

There seem to be two other causes of its loss in gardens. One is the want of occasional top-dressing, which should consist of working among the foliage with the fingers in spring and autumn a little loam and sand. The other appears to be confinement in a small space until the soil becomes exhausted. Its creeping habit suggests this, and where it cannot spread into "pastures new" it should be lifted and replanted in fresh soil. Wooster recommends "rich loam and sand," but I think it is benefited by adding fibrous peat or leaf-mould. The Mazus flowers in June and July.

MR. JAMES HUDSON, V.H.M.

PRIMULA SUFFRUTESCENS.

Numerous Primula lovers have attempted the cultivation of this sub-shrubby Primula, which is a most interesting plant, but have in most cases failed to retain it for long. This is little wonder, as we cannot give it anything like the natural conditions which prevail in its haunts. Here is an account of its home which makes us almost despair of supplying this Sierra Primrose with its wants. "If one takes his alpen-stock in hand and climbs to the snow-line in late summer he is apt to be rewarded by the charming flowers of the Sierra Primrose. The little plants grow in the drip of the snow-banks, where the melting ice gradually liberates the tufts of evergreen leaves. The glowing flowers look as though they might have caught and held the last rosy reflection of the sunset upon the snow above them." Thus writes Miss Parsons, in her book, *The Wild Flowers of California*, and it is a matter for surprise and says much for the adaptability of this Primula that it does not at once disappear in our climate without its covering of snow in winter and its supply of icy water at flowering time. The serrated leaves are evergreen which increase their difficulties in this country, and the most successful growers I know have contented themselves with growing it under glass in winter and spring. It succeeds better in some districts than in others, especially where the climate is dry, and Dr. John MacWatt's experience at Duns is worth quoting. He says it is "quite hardy in light, well-drained soil if planted in a position sheltered from strong winds." But it is largely a question of winter treatment and shelter from our variable winters.

LYCHNIS ALPINA.

Is not this little Alpine scarcer than it was a dozen or more years ago? I think this is the case, and it seldom comes under one's ken in going through rock gardens, even of some note. It is a pretty, if not showy, little plant, growing only a very few inches high and partaking a good deal of the appearance of Lychnis Viscaria, but it is not viscid. The flowers are a shade of red purple, and the plant makes a neat little carpet of green leaves, in summer well relieved by the flowers. One of the ablest of writers tells us of the position it occupied in one of the few British habitats, and this is interesting and affords us useful hints as to dealing with L. alpina. It was observed on high cliffs, and in perfect health where not a drop of rain was likely to reach it, but seedlings, apparently from the above plants, were doing well on moist, crumbly rock. I have had no difficulty in growing it on almost level rockwork in crevices between stones and in a dry place facing east. It has been met with thriving in other exposures. Some of the best plants I have ever seen were growing on an almost level spot on a rockery facing south-west and in loam, sand, and leaf-mould, in a pocket of the rockery, and occasionally top-dressed with grit. This neat little plant may be raised from seeds or increased by division.

ANEMONE NEMOROSA BLUE BONNET.

This plant is one of the best of the blue varieties of Anemone nemorosa, the Wood Anemone. It has large flowers of a clear blue. In addition to its value because of its large blooms it is desirable on account of its blooming later than the others. It loves a shady spot, and is an excellent subject for planting in a thin shrubbery or under the shade of deciduous trees, although it is also very beautiful in the open. *S. Arnott.*

NOTES ON CULINARY PEAS.

Culinary Peas are generally regarded as a vegetable of first importance, so that in every garden strenuous efforts are made in order to maintain an adequate supply during the period of the year when they are in season. Difficulty is sometimes met with, at times local in character; it may be an error on the part of the cultivator, or we can trace the loss of a crop, at times, to that most insidious of foes, namely, mildew. The general conditions under which Peas succeed are fairly well recognised, consisting mainly in deep cultivation of the soil. They are deep rooting subjects, and, given the means for firmly establishing themselves, few plants are more free from inherited weakness or disease than standard varieties of garden Peas as they exist to-day.

Mere digging of the soil is not conducive to the best results, and every cultivator should aim at producing a working tilth at least 2 feet deep for this crop. This end is secured by a regular system of trenching the ground, at the same time working into the bottom spit all garden refuse capable of being converted into soil and placing under the top spit a liberal dressing of well-decayed manure. On land not previously trenched it is advisable to retain the bottom spit in position until this system is practised for several years, when it may with advantage come to the surface. Trenching is best performed before the New Year, allowing the surface to lie rough and be acted upon by weather.

In spring a dressing of soot and fresh slaked lime should be applied and forked in previous to planting or seed sowing.

In order to secure free, uninterrupted growth, it is necessary to retain the natural moisture in

TRADE NOTES.

Early in 1918 the Agricultural Wages Board appointed a Committee, under the chairmanship of Sir Henry Rew, to inquire into the financial results of the occupation of agricultural land and of market gardens, in view of the cost of production under existing conditions, and the present controlled prices for farm and garden produce, and also to inquire into the cost of living as affecting workers in rural districts. The Report of the Committee was presented to the Wages Board on March 13, and has now been published as a Parliamentary Paper.

The Committee heard a certain number of witnesses, but their task was mainly that of collecting, examining and weighing a large mass of documentary evidence, collected for the most part specially for the purpose of this inquiry. On the side of farming costs, a schedule drawn up by the Committee was widely circulated among farmers with a view to obtaining particulars for each of the past five years under the main items of receipts and expenditure. The results of this part of the inquiry were somewhat disappointing, only 119 schedules being returned completed. These schedules represent, however, only a small part of the mass of material on which the conclusions of the Committee in regard to the first part of their terms of reference are based.

An analysis of the statistics collected of changes in the prices of farm products and of form requirements (including labour costs and rent) shows an increase in these elements in the farmers' accounts, as between 1913-14 and 1917-18, of about 100 per cent. in each case. This is not to say that the actual receipts and expenditure had changed in this proportion. Prices of products are in some cases merely nominal, the actual sales being very small; while on the other hand the quantities of materials used and the amount of labour employed had diminished very substantially.

The most definite evidence on the financial results of farming laid before the Committee was that dealing with expenditure and receipts on a number of farms, including "tenant," "home," "co-operative" and "co-partnership" farms. The cash profits or losses which the differences between expenditure and receipts represent show an extraordinary diversity, but that farming was substantially more profitable in 1917-18 than before the war appears to be amply demonstrated. The conclusion of the Committee, based on an analysis of the cash statements of the tenant farms, and after making allowances for the value to the farmer of his house, and the subsistence derived from the farm, is that the farmer's average pre-war net returns from farming were in the region of 9s. to 10s. an acre, and that in 1917-18 these had risen to about 34s. an acre. Since then the position has been changed by the operation of the Agricultural Wages Board's Awards, the full effect of which was not felt in 1917-18. The Report goes in some detail into the question of the rate of interest earned by the farmer's capital, and the changes in this element during the period of the war. An apparent increase in farming profits will require modification in view of the depreciation in the general condition of the farms resultant upon enforced economies in the application of fertilisers to the land and in the upkeep of equipment. On the other hand, restrictions on the purchase of feeding stuffs and on the employment of labour may have been the cause of real economies in productions which may to a certain extent, at any rate, become permanent. Considerations of this character receive interesting and suggestive treatment by the Committee.

The consideration of the changes which have occurred in the cost of living of agricultural labourers involves a reference of the ability of the workers to bear an increased expenditure, and this is provided by a measure of the increase of wages. The average minimum rates for adult male workers fixed by the Wages Board, which include, of course, the value of allowances which can now be reckoned as part of wages, are 31s. 5d. for ordinary labourers, 38s. 1d. for stockmen, and for both classes combined 33s. These figures represent, according to the Committee's findings, an increase on the corresponding figures for 1914 of 83 per cent. in the case of ordinary labourers, 103 per cent. in the case of stockmen, and 88 per cent. for both classes combined. The average increase in the cost of labour to the farmer is, however, only about 50 per cent., the difference being mainly due, of course, to the depletion of the ranks of labour for war purposes. An interesting fact revealed by the inquiry is that the effect of fixing minimum rates has been substantially to narrow the gap between the highest and the lowest paid counties.

In the matter of the material for an estimate of the cost of living of farm workers the Committee were more fortunate than in regard to the first part of their inquiry. By the co-ordination of the inquiries on this subject with those instituted by the Sumner Committee on the Cost of Living of the Working Classes, it was possible in the result to secure a body of nearly three hundred family budgets of rural workers for a week in June, 1918, to which material over 100 further budgets collected by the Investigators employed in the Inquiry into Wages and Conditions of Employment in Agriculture, relating to the spring of 1918, constituted a valuable addition. Nor was there any lack of material as to the course of retail prices of food and other commodities consumed by farm workers and their families, the returns obtained from co-operative societies in the smaller towns and villages of England providing an excellent

THE LATE HENRY HOWARD.

but by no means the only basis of comparison in the two periods under review. The estimated increase between 1914 and June, 1918, in the expenditure of a typical farm worker's family, the size of which, on the average, ranges between 5 and 6 persons, is found to have been about 85 per cent., with a further increase to 93 per cent. in January of the present year. Up to this latter date wages may be said to have nearly kept pace with cost of living as measured by the expenditure of a typical family. There were, of course, considerable modifications in diet in the two periods, but the nutritive value was not substantially different.

Throughout the Report the Committee draw attention to the instability of all the data with which they have had to deal, and in summarising the results they lay emphasis on the fact that they regard the evidence as inadequate to support more than very tentative conclusions. This inconclusiveness is inseparable from an inquiry made at a time when conditions are in no way normal, when prices are artificial, the result of Government control and not of free competition, and when purchasing is restricted both by direct control and by lack of supplies. The Report contains much useful information, but it concludes with an emphatic assertion of the need for further inquiry "before it can be said that the full facts either as to the farmers' or workers' position are available."

Reports are extremely varied as to the actual condition of commercial horticulture in Holland. Some reports suggest that Dutch nurserymen are in a bad way and have reduced stocks of many subjects as a consequence of food production; other reports suggest that there are large stocks ready for export. In this connection, and in others, the Horticultural Trades' Association has arranged to send Messrs. G. W. Leak, A. Bide, R. W. Wallace, Herbert Smith and Chas. E. Pearson to investigate and report. The party will leave for Holland on April 25.

Messrs. John K. King and Sons, Coggeshall, Essex, have received the Royal Warrant of Appointment as seedsmen to His Majesty the King.

Obituary.

Walter Thomson.—It is with deep regret that we record the death, at the comparatively early age of 49, of Mr. Walter Thomson, who has been for the past 17 years gardener to the late and present Dukes of Northumberland, at Alnwick Castle. Mr. Thomson was a gardener of exceptional attainments, with wide and varied knowledge of practically all subjects in horticulture. He was, however, perhaps at his best with fruit—outside as well as inside, a branch of horticulture for which the gardens at Alnwick Castle have long been widely famed. He was studious and observant, not so much a student of books as of nature itself, and rarely failed to master the problems which confront the gardener year by year. Before entering the service of the Duke of Northumberland he was for several years gardener and overseer to General Pitt-Rivers at Rushmore, and he was at one time in the service of the late Lord Roberts. He was a former member of the Kew gardening staff. He was singularly modest and humble, approachable to all comers, and to those who enjoyed his closer intimacy and friendship he disclosed a deep, rich nature, a delightful fund of humour, and was constancy itself. During the past winter he showed some signs of failing strength, but it was hoped that with returning warmth he would regain his usual vigour. He was attending to his duties up to the day he took to bed, and although everything that medical skill and loving affection could do he gradually sank and passed peacefully away. He leaves a widow, one daughter and three sons, to whom we extend the deepest sympathy in their great sorrow.

Henry Howard.—We announce with deep regret the death of Mr. Henry Howard, who was for 33 years in charge of the estate and gardens at Purfleet, Essex. Mr. Howard died on April 7, aged 67 years. He was a fellow of the Royal Horticultural Society, and a regular attendant at the shows and meetings of the Society. He was a life subscriber to the Gardeners' Royal Benevolent Society. He conducted the work on the Purfleet Estate in a very able manner and was held in much esteem in the district in which he lived. During his career at Purfleet he raised many seedlings of Daffodils and Lilium tigrinum. The funeral took place at West Thurrock on April 10.

CROPS AND STOCK ON THE HOME FARM.

Sugar-Beet.

Among the root crops that may profitably be grown for feeding stock, Sugar Beet deserves consideration. It is also of importance at present to ascertain in what districts of this country its growth on a larger scale for the manufacture of sugar might eventually be recommended. Farmers, especially if they have not hitherto had experience of this crop, would do well to sow a breadth or so to serve mainly for stock-feeding purposes. At the same time their experiences with a small area will supply useful evidence as to the possibilities of cultivation on a larger scale.

A crop of at least 10 tons per acre may be expected, and there are instances where as many as 18 tons have been obtained. To sow one acre

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Culinary Peas (see p. 161).—The article by Mr. E. R. Janes on "Culinary Peas" will, I am sure, have the endorsement of all thinking gardeners. Soil often becomes manure sick by the constant application of farmyard dung, and in the case of culinary Peas, if the ground has been well manured the previous season for Celery, a good application of lime is all that is necessary to produce an excellent crop of Peas the following season. I can heartily endorse his remarks, too, about stating how often one sees the stakes meeting at the top like a span-roofed greenhouse, with the result that the object for which the stakes are used is completely defeated. The stakes should be at least 18 inches wider at the top than at the bottom in order to allow the haulm room to spread. Mr. Janes hits the nail on the head as to watering: I have seen gardeners in the height of the summer, when the ground is very warm, soaking Peas with water direct from a very cold well or reservoir. *D. White, Theydon Place Gardens, Epping, Essex.*

Sunflowers for Seed.—Some writers have recorded disappointment in the growing of Sunflowers for seed for poultry. We had a useful addition to the sawdust-like, non-nutritious "meals" that were obtainable. The year before I selected seed from the shortest plants with the largest blossom heads; thus we had not more than two or three which exceeded about five feet in height out of a few hundred. Owing to wind effects it appeared useless to make use of the giant varieties which were advocated. Many were planted out along a fence. Unfortunately, a man I had working planted out many under and in the shadow of some fruit trees. As anticipated, these did not succeed. We gathered the heads as soon as the peripheral florets began to wither, cut off the main part of the still fleshy, broad stem, and dried the seeds under cover, after rubbing off all florets to facilitate drying. If gathered thus early the seeds are fully formed, but the birds have not yet started their attack. Many of the small secondary flowers failed to ripen seeds or became mildewed in the late season. Maize, which was planted between, or near by, the Sunflowers, also afforded a useful addition, though not enough was grown to keep our few hens going. Buckwheat was also tried, but this crop was a failure, as greenfinches and blue tits descended upon it and cleared the seed as it ripened. Evidently Buckwheat needs growing by the acre, and is no use for small or garden culture; the green haulm was greedily eaten by ducks and fowls. A friend has just related to me that he lost much of his Sunflower seed through rats, which were observed to climb the stems. *H. E. D.*

An American's Impressions of the Chiswick Shows.—Thinking it may be of interest to your readers, I send herewith an extract from a personal letter of Mr. Henry Colman, Boston, U.S.A., showing the importance of the Horticultural Shows held at Chiswick under the auspices of the Royal Horticultural Society 75 years ago. Mr. Colman was a prominent agriculturalist and Secretary of State, and visited this country to study and report upon European agricultural methods.—*Jeremiah Colman.*

(Extract from *European Life and Manners*, vol. I., p. 212.)

Being Personal Letters from
Henry Colman, Boston, U.S.A.
London, 18th June, 1844.
56, Charing Cross Road.

"My dear M.——

". . . . On Saturday last I went to the *fete* of the Royal Horticultural Society, at Chiswick. The terms of admission here are made difficult, so that the company may be select. You may judge how select they choose to have the company when I tell you that five shillings, more than a dollar, are required for a ticket of admission before the day of the show, and seven-and-sixpence on that day, if you purchase your ticket at the gate; and no free tickets are given to anybody, nor can a ticket be purchased without the recommendation of a member. Chiswick is seven miles from London. It is a matter of etiquette for the ladies to go in full and elegant dress. There were more than fifteen thousand people in the gardens, and four bands of music, and as to the carriages, there were not only acres but miles of them. I went in a public conveyance, and when we reached the first carriage in the line waiting for its turn to drive up and set down the company at the gate, we were then nearly three miles from the place. But they must all wait their turn, as the police would not let one go before another. It is impossible for me to tell you how beautiful the flowers and fruit were, and how still more beautiful the ladies were."

Gardeners' Hours and Wages (see pp. 128, 144, 157).—There is a fallacy concealed in *Mr. H. Chivers'* comparison of the lad of 18 in the garden and in the army. In the latter he can learn all that is necessary in a few weeks or months, provided that he is then efficiently commanded and led, but in the garden trees cannot profitably be pruned at the word of command nor will the order "As you were" restore a plant that has been killed by transplantation at the wrong season of the year. A head gardener can control to some extent, but the mischief that can be done by the inexperienced is untold. Therefore there is no real comparison between the two. Gardening skill is only won by experience, and it is hardly to be expected that an unskilled youth of 18 should command full wages. At the present moment I am willing to take into my garden and teach him all I can about Irises, Tulips, and vegetables any young gardener who is keen to learn. I cannot afford to pay full wages if that means £2 a week, and if *Mr. Chivers* is to have his way and to prevent any gardener from accepting less than the maximum wage, there seems no course open to me but to give up my garden altogether. *W. R. Dykes, Charterhouse, Godalming.*

——The case for gardeners has been aptly put by *W. W.* and *W. Chivers*. Mr. Elwes holds out a very poor prospect for the future of our profession. He says, judging by the advertisement columns in your paper, there are many more gardeners wanting places than there are places vacant. No doubt there are at present, owing to demobilisation, but the statement is rather misleading, as many employers prefer answering advertisements to advertising; and, again, many gardeners who are wanting places are not necessarily out of work, but are seeking a change to improve their position. Mr. Elwes, who is, I presume, an employer of labour, says the war has taught us to do without many things we had before. Quite true; many of us have had to go short of the necessaries of life. He probably means luxuries. As a gardener with 25 years' experience in private gardens and nurseries, I do not envy the one skilled man who may have to carry on with inexperienced labour, consisting of old men, boys and women. I am afraid his pleasant manners would often desert him, however much he loved his profession. With all due respect, I would ask Mr. Elwes what he considers a fair living wage for a gardener, taking into consideration the present high cost of living. We are up against the stern realities of life and cannot live on poetry, much as we might and do appreciate it. The present rate of wages paid to skilled gardeners is much less than is paid for unskilled labour in many other occupations, and yet we are expected to keep smiling and carry on with a contented mind. I belong to no union, so will sign myself, *Free Man.*

Women in Horticulture (see pp. 77, 156, 169).—Having been a woman-gardener since long before the war, I have read with much interest the correspondence connected with women in horticulture, and my opinion is that women who are good at their work and keen gardeners are not being dismissed, unless it is at the hands of an unpractical 'woman-head" who pays attention to affairs not concerning the work itself, and things which a man head-gardener is too businesslike to take up. I do not think any woman minds giving back to the demobilised man his own position, but it certainly is unfair when she is refused a reference, particularly so if she means to "stick to it," as many of us do. It is true women have "roughed it," living in damp and unhealthy bothies, and it seems to me they would now appreciate a little consideration on giving up their places to the men.—"*Referenceless.*"

"Clarkeara" Paul (see page 184).—A hybrid from the three genera Brassavola Laelia and Sophronitis has previously been raised and named Lowiara, as recorded in *Orchid Review*, 1912, p. 360. The name of Colonel Clarke's plant is therefore Lowiara Paul. *W.*

ROYAL HORTICULTURAL.

TRIAL OF KALES.

The following awards have been made to Kales after trial at Wisley.

Award of Merit.

Ormskirk Hearting Curled Greens, sent by Mr. Clucas.

Highly Commended.

Cottager's Kale, sent by Messrs. R. Veitch and Son; Dwarf Purple Curled, sent by Messrs. Barr and Sons; Extra Curled Scotch, sent by Messrs. Sutton and Sons; Favourite, sent by Messrs. Sutton and Sons; Green Curled, sent by Messrs. Robert Sydenham, Ltd.; Improved Hearting, sent by Messrs. Sutton and Sons; Purple Plume, sent by Messrs. J. Carter and Co.; Scotch Kale Selected, sent by Messrs. Barr and Sons; Jerusalem Purple, sent by Messrs. Barr and Sons; Variegated Kale Selected, sent by Messrs. Barr and Sons, and recommended as a decorative variety.

SCOTTISH HORTICULTURAL.

APRIL 1.—The monthly meeting of this Association was held on the 1st inst., Mr. Fife, President, in the chair.

A lecture on "Soil Organisms" was delivered by Dr. W. G. Smith, Edinburgh and East of Scotland College of Agriculture. All fertile soils, he said, harbour a vast population of living organisms, some of which are useful and others harmful to cultivated plants. The organisms which prepare nitrogenous food have been most studied. These obtain nitrogen from the air (azotobacter) or from farmyard manure and plant remains (nitrification). Certain conditions favour the operations of these soil organisms, and these conditions are part of good practice. The effects of cultivation and manuring were shown to have a bearing on the soil organisms, apart from the soil itself and the feeding of the crop plant. Injurious soil organisms utilise plant food, destroy useful soil organisms, and interfere with fertility. The method of checking these by partial sterilisation of soils by steam and heat was described.

CHESTER PAXTON.

THIS energetic Society, of which Mr. T. Gibbons Frost, J.P., is the president, Mr. N. F. Barnes, Eaton Gardens, chairman of committee, and Mr. G. P. Miln, J.P., honorary secretary, has, from 1889 until 1914, organised lectures and demonstrations chiefly for the purpose of encouraging the extended culture of hardy fruits throughout its district, which embraces Cheshire and North Wales. In keeping with the spirit of the times, the exhibitions were discontinued for the period of the war, but the Society has nevertheless continued its educational work in another direction. Immediately the Cultivation of Land Order came into operation the members of the Committee placed their services at the disposal of the plotters, and those of them who were novices at gardening gladly accepted the help of these practical men, with the most beneficial results. The Society also offered a series of prizes and cultural certificates for the largest crops and best kept plots. Illustrated lectures specially adapted for allotment holders and those having cottage gardens, were also organised and were largely attended. Six allotment holders have been added to the Committee, a step which is anticipated will give the plotters a greater interest in the work of the Society generally.

BULL'S FOOD
FOR
PLANTS, FRUIT and VEGETABLES

makes just the difference and is distinctive because it also feeds the soil, providing it bountifully with that in-dispensable organic nutriment so essential to the vigorous production of all Plant life, rendering the poorest rich and abundantly prolific, hence its magic power in the soil, trebling the yield of Fruit and Vegetables.

12 lb. of seed is sufficient. The last week in April or the first week in May is a suitable time for sowing. For feeding purposes it is estimated that 4 lb. of good Sugar Beet are equal to 8 lb. of Mangolds or 1 lb. of cereal meals in mixed rations.

It has been arranged to distribute a quantity of good sound seed in parcels of 16 lb., 8 lb., and 4 lb., at 3s. 6d. per lb., including bag and carriage. Applications, accompanied by remittance, should be made to Mr. Alfred Wood, Secretary British Sugar-Beet Growers' Society, 14, Victoria Street, London, S.W.1. Particulars as to cultivation may be obtained from the Secretary, Board of Agriculture and Fisheries, 72, Victoria Street, London, S.W.1.

Charlock.

Charlock (Brassica sinapis) is an increasing pest on light soils in some counties, especially since the war began. When a field is prepared for a cereal crop during March or April, or for Turnips later, the surface is made quite fine, in which the Charlock seed germinates freely. By harrowing the ground, one crop of Charlock seedlings will be destroyed. The spraying of Charlock among Turnips, Mangold, or Vetches, or any plant with rough foliage is not practicable, as the specific adheres to the leaves as it does in the case of Charlock, and injures the plant. Among cereal crops, however, the danger is not present: the leaves or "flag" being smooth, the spray fluid does not adhere to the surface. As roots generally follow a cereal crop, it is reasonable to suppose that if the Charlock among cereal crops is killed the plant will not perfect a crop of seed to grow among the roots. It is also reasonable to suppose that by constantly killing the Charlock plant among the cereals there will in time be less on the farm. Any cereal crop, such as Wheat or winter Oats, that is sown in the autumn is not liable to this pest, as Charlock cannot withstand frost; hence it is that winter Oats are now more largely grown than formerly.

The spraying should be done directly the first rough leaf has formed. Too many neglect spraying until the plant has grown large and become hard and woody. In that stage the spray fluid has not the same effect as when the leaves are more succulent. Thirty to forty pounds of copper sulphate to 100 gallons of water is a safe quantity to use with a sprayer which distributes the solution in form of a fine mist. Fifty gallons per acre are required. *E. Molyneux.*

ANSWERS TO CORRESPONDENTS.

Big Bud Mite: *G. L.* We forwarded your query to Mr. A. H. Lees, who obligingly replies as follows:—The methods for the control of Big Bud Mite may be divided into two classes, spraying and cultural. Success has been claimed for repeated applications of a contact wash during the early growing season. This, however, necessitates six to ten separate sprayings and therefore is not economically possible, except in the case of nursery stock or in private gardens. Dustings of lime and sulphur have also had advocates, but my own experience of this is that the three prescribed dustings only checked the mite to a very small extent (five-sixths of the control) and also caused some burning. Of the cultural methods, the most successful is picking off the big buds in the winter and destroying them. This method seems to check the mite without ever eradicating it. For success, the bushes must be dealt with more than once, preferably at least three times, and the picker should approach the bushes in a different direction each time, so that buds missed the first time may be seen on the next occasion. This method has given good results in practice. Secondly, badly affected bushes should be grubbed up and destroyed. Cutting the bushes right down to the ground has, in some cases, given good results, though in other cases it is stated that disease has quickly followed the new growth. In order to avoid missing a crop it would be as well to plant twice as closely as usual, thus allowing for a periodical cutting-down of alternate bushes when necessary. There is evidence to show that the infection from bush to bush is slow, but from twig to twig on the same bush it is fast. I am not aware that this method has been tried yet, but it would be worth a trial. There is evidence to show that any factor promoting late vegetative activity, such as a strong growing variety or a wet season or climate, favours big bud development and it is along these lines that a possible cure or mitigation may be found. The subject is being investigated at Long Ashton, but it is too early yet to give any indications of the results.

Erecting a Conservatory: *Oakfield.* As the shape of the glass-house you suggest erecting is somewhat unusual, it would be wise to ask a competent architect to submit plans, as an ordinary conservatory would not be suitable. As you wish to use this building for the growing of plants a glass roof is essential, for although many plants may be wintered in a frost-proof shelter without much light, a glass roof is necessary at other times. Apart from the flowering shrubs which you propose growing and which would be placed out-of-doors during the summer, Palms, Tree Ferns, Cordylines, and Phormium tenax would be suitable foliage plants for furnishing the house. Chrysanthemums would flower quite well in such a conservatory from October to January, provided they are well grown and prepared previous to housing them in September. Melons would not thrive in such a house, neither could they be grown with the class of plants you name. With a glass roof, and the sunny position you suggest, Tomatos could be cultivated in boxes, but we should not advise mixing them with other plants needing syringing, as this would be detrimental to the Tomatos. If you clear the house of the other subjects, Tomatos could be grown in it during the summer. The Tomatos should be cleared out and the house thoroughly cleansed before the Chrysanthemums are housed at the end of September. If you decide to keep the house solely for decorative plants during the summer, the roof glass should be shaded from direct sunshine in April. This may be done by light blinds, or by painting the roof glass with one of the mixtures sold for the purpose by horticultural sundriesmen.

Grapes Shanking: *D. D.* Shanking in Grapes is not due to organic disease but is the result of a check of some kind. The most frequent cause of the trouble is an unsatisfactory condition at the roots and this is especially the case with Grapes grown by amateurs whose vines are planted in borders that have not been properly prepared. The vine needs plenty of moisture during its season of active growth, but stagnant moisture at the roots is very harmful. It is, therefore, necessary to make provision for surplus moisture to pass away readily by providing suitable drainage where the soil is naturally of a retentive character. Shanking may arise from inattention to such details as ventilating, removal of surplus shoots and sudden extremes of temperature. At the end of the season, when the vines are resting, examine the borders and if the roots are found to be in an unsatisfactory condition lift them entirely and remake the border, taking care to provide efficient drainage. It is necessary to induce the roots to grow near the surface and to form plenty of fibrous roots. This is best done by placing mulches of rich material on the surface of the border in summer and allowing plenty of air to enter the soil by pricking up the surface lightly whenever it becomes caked.

Grubs in an Apple Stem. *G.*:—The grubs are the larvae of a bark-boring beetle. They are possibly a species of Cryphalus, but it is impossible to be sure without seeing the adult. This genus makes irregular, cavern-like borings under the bark but they do not penetrate the wood. They are capable of destroying a tree in two or three seasons, and should therefore be dealt with drastically. Where possible, the wood should be cut out and burnt, in other cases the bark should be treated with a strong disinfectant such as lysol.

Insects on Loganberries. *G. T.* The pest is doubtless the Raspberry and Loganberry beetle (Byturus tomentosus). Nicotine-paraffin emulsion gave good results on a commercial plantation when used as a double spraying once a week for three weeks, but the trouble involved is rather great. Last season there was evidence to show that deep culture (say, deep hoeing—three inches) almost entirely controlled it. We suggest, therefore, that you try thoroughly cultivating your ground in the spring when the beetles are coming out, from the middle of April to the middle or the end of May, and again when the beetles are going down into the ground, from the middle of July to the end of August. The grub eating out the tops of the young shoots may be several pests. Send specimens when it appears.

Names of Plants: *S. A. K.* Boussingaultia baselloides, sometimes named Madeira Vine, though Ecuador is its native country. *F. K.* 1, Pernettya mucronata; 2, Phillyrea angustifolia; 3, Blechnum spicant; 4, Gaultheria Shallon; 5, Megasea cordifolia; 6, Kalmia glauca; 7, Phormium tenax variegata; 8, Luzula sylvatica (Wood Rush); 9, Petasites fragrans.

Tennis Court. *L.L.*:—The diagram in fig. 91 shows the correct dimensions of a Tennis Court:—

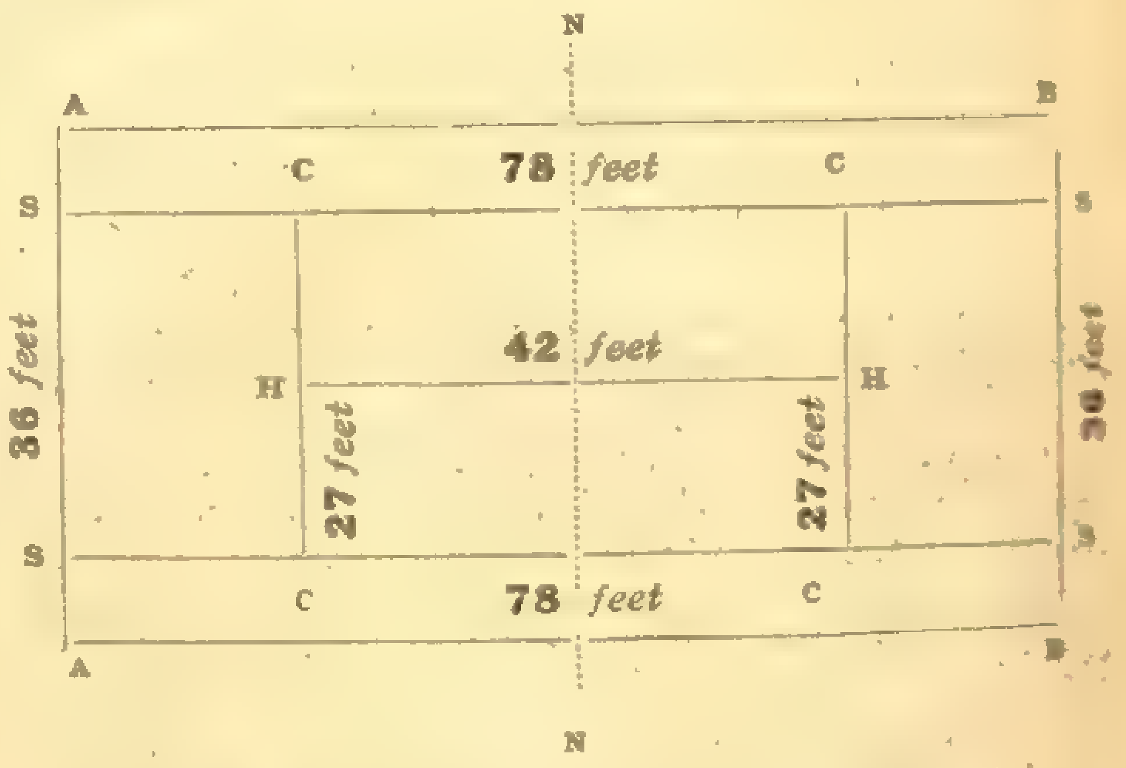

Fig. 91.—Plan of a tennis court.

The lines A B and B A, indicate a double court for three or four players, S S, S S, a single court for two players; A A and B B are the base lines; C C and C C service lines; H H, half-court line; N N net. A court for the single game is twenty-seven feet wide, and seventy-eight feet long; and for the double game, seventy-eight feet long and thirty-six feet wide. The posts for supporting the net should be placed three feet beyond the sides. The service lines run parallel to the net, and are twenty-one feet distant from the same. The net should be three feet high in the centre, and three feet six inches at the posts, to allow of the net dropping.

Watercress Culture: *A. S. R.* The only work we know dealing with this subject is *Commercial Gardening*, published by the Gresham Publishing Company, Southampton Street, Strand. It deals fully with cultivation and propagation. The Watercress would probably derive no benefit from a nitrogenous chemical manure added to the water in which it is growing, as the fertiliser would probably be almost completely washed away before it could operate upon the plants. To secure a crop of Watercress free from flowers during the summer months it is advisable to grow the "green" variety. Cuttings may be placed in clean and slowly-running water at any time between June and Christmas, and in favourable conditions cutting may begin six to eight weeks afterwards. To maintain a supply of Watercress all the year round, the "brown" variety should be grown as well sa the "green," as it is in season from about Christmas to June. Each year a portion of the beds should be cleared from the older plants, and a new stock raised from cuttings.

G. TAYLOR thanks the numerous applicants for the post of Outside Foreman, in Bucks., which is now filled.

WANTED, HEAD WORKING GARDENER for Gloucestershire; thorough experience all branches; Private Grounds; 2 other men and boy kept. Write full particulars, age wages required, etc.—G. M., Box 2, 41, Wellington Street, Covent Garden, W.C.2.

GARDENERS.—Wanted, three good MEN, one for Houses, one Kitchen Garden, one Pleasure Grounds. Bothy and coal found.—Send references and state wages required.—CAPTAIN MILLER, Coundon Court, Coventry.

WANTED, GARDENER (with help); Inside and Out; reliable strong Man, interested in his work; no rooms. State full particulars, wages, experience, etc.—H., Worton Court, Isleworth, Middlesex.

WANTED, strong, capable, willing GARDENER (second of three). Excellent references essential, single, wages 32s.—Apply, stating age, experience, and full particulars, to Rt. Hon. H. PIKE PEASE, M.P., Merrow Croft, near Guildford.

WANTED, good SECOND GARDENER; must have general knowledge of Kitchen Gardening and Plant House; wages £2 per week; good character required.—Mr. FRENCH, The Gardens, St. Leonards, Windsor.

GARDENERS wanted, SECOND and THIRD; must have experience; wages 37s. and 32s.; single. —Apply GARDENER, The Gardens, Greenford Green, Harrow.

WANTED, SECOND GARDENER; four kept, used to horse mower. State age, wages, and experience.—T. EDGE, Esq., Strelley, Nottingham.

WANTED good SECOND of three; thorough outside experience; 30s. and cottage; state age and family.—E. C. SEVERNE, Esq., Thenford House, Banbury.

WANTED, UNDER-GARDENER for Outside and Mowing. Good references required.—Apply, MRS. LAW, Wentworth Hall, N.W.7.

WANTED for Herts, capable UNDER-GARDENER with knowledge of Herbaceous Borders; not required for Glass; Sunday duty once in three weeks; excellent cottage with large cottage garden; seeds provided.—Write experience and wages, F. BRAUND, Leadenhall House, 101, Leadenhall Street, London, E.C.3.

WANTED, FOREMAN (Inside); wages 36s.; excellent bothy, milk, vegetables and attendance —Send copies of references to GEO. JOHNSON, Milton Hill Gardens, Steventon, Berks.

WANTED, for Pleasure Grounds, FOREMAN or LEADING HAND; one who has had experience in Trees and Shrubs and Herbaceous Plants; wages 35s. and cottage.—Apply, stating age, experience, with copies of testimonials, to F. J. CLARK, Aston Rowant Gardens, Oxon.

WANTED, FOREMAN (INSIDE).—State experience, wages required with bothy, &c., to C. GARRATT, Canwell Hall Gardens, Sutton Coldfield.

WANTED, FOREMAN for Fruit and Plant Houses, good wages, with bothy, etc.—Apply with particulars to HEAD GARDENER, Revesby Abbey, Boston, Lincs.

WANTED, JOURNEYMEN (OUTSIDE); wages 30s., bothy, Vegetables, Potatos, &c.; 7 in bothy.—H. R. WHITELAW, Hever Castle Gardens, Edenbridge, Kent.

WANTED, JOURNEYMAN for Plant and Fruit Houses; wages 30s., duty and overtime paid; bothy, milk and vegetables.—State age, experience, W. KINGSWOOD, The Gardens, Norman Court, Salisbury.

WANTED, JOURNEYMEN for Inside and Outside; large establishment in Yorkshire; 30s. weekly, paid for Sunday duty; bothy, etc.—Send full particulars to D. BROUGH, Coollattin, Shillelagh, Co. Wicklow.

WANTED, two good JOURNEYMEN for Outside; wages 30s. and bothy; age about 22, with experience.—Apply to W. WARD, Ken Wood Gardens, Hampstead, London, N.W.3.

WANTED, JOURNEYMAN for the Pleasure Grounds; wages 30s. week, bothy and attendance.—T. WARRINGTON, Foliejon Park, Windsor, Berks.

WANTED, JOURNEYMAN for Pleasure Grounds, help with duty. State wages required with bothy and vegetables. Give particulars of experience. 1 o'clock Saturdays.—C. MOORE, Wargrave Manor Gardens, Berks.

WANTED, JOURNEYMEN GARDENERS; good wages and bothy.—Full particulars and references to HERD BROS., Nurserymen, Penrith.

WANTED, JOURNEYMEN, chiefly for Outside work, for large place in Bucks; 30s. per week; bothy, etc.—Apply, G. TAYLOR, Byram, Ferrybridge, Yorks.

WANTED, JOURNEYMAN, about 20, chiefly for Fruit Houses; also SINGLE MAN for Kitchen Garden.—Apply, stating experience and wages required, to F. J. ROSE, South Stoneham Gardens, Swaythling, Southampton.

WANTED, MAN (SINGLE) for Vegetable growing, capable of taking charge under foreman.—Please state experience and wages required, to SECRETARY, Research Station, Long Ashton, Bristol.

WANTED, a MAN for Inside and Out, to help in Kitchen Garden and on Lawns; able to take duty alternate weeks; married; wages 33s. weekly; 2 rooms and light duty paid extra.—Full particulars to E. SMITH, Falcon Wood, Shooter's Hill, S.E.18.

EXPERIENCED SINGLE MAN required for Kitchen Garden and Pleasure Grounds; little duty; one o'clock Saturdays; good lodgings on the place; wages 35s.—Copies of references and particulars to GARDENER, Pirbright, Chipstead, Surrey.

WANTED, good active YOUNG MAN, chiefly for Inside, and with some experience of Orchids. Wages 32s., no bothy.—Apply, H. REDDEN, The Gardens, Manor House, West Wickham, Kent.

WANTED, YOUNG MAN for Roses, take charge of Croquet and Tennis Lawns with assistance. Bothy and vegetables; share duty; 35s.; 1 o'clock Saturdays.—GARDENER, Poles, Ware, Herts.

WANTED, YOUNG MARRIED MAN for general outside work; good cottage and garden. Also Strong Youth for general garden work, able to take duty; bothy, attendance.—Apply, stating age, experience, wages required, C. BLAKE, Clandon Park, Guildford.

WANTED, two YOUNG MEN for Pleasure Grounds and Kitchen Garden. Write, stating age, wages required (with good bothy, vegetables, and attendance, 1 o'clock Saturdays), to H. NAYLOR, Pleasauna Gardens, Overstrand, Cromer.

WANTED, YOUNG MAN for Herbaceous Borders, Rose Garden and Lawns. Bothy and vegetables, 1 o'clock Saturdays; state age, experience and wages required.—G. LOCKE, Cassia Gardens, Winsford, Cheshire.

WANTED, a YOUNG MAN, experienced in Kitchen Garden and Pleasure Grounds; take duty; bothy and vegetables; one o'clock Saturdays.—Particulars and wages required to J. A. MULFORD, Merevale Hall Gardens, Atherstone, Warwickshire.

WANTED, active single YOUNG MAN, Inside and Out, chiefly Outside, used to Lawn Mowers; good wages paid; with comfortable bothy, etc., and attendance; one o'clock Saturdays.—Apply, stating age, experience, with copies of references, to H. G. SHAW, Bryn-Lupus Gardens, Llandudno, North Wales.

WANTED, active YOUNG MAN (single), for Inside and Outside work; understands Horse Machine; take turn with duty; good wages given.—Apply, E. NEAL, Tilgate Gardens, Crawley, Sussex.

WANTED, SINGLE MAN for horse-drawn Mower and assist in Kitchen Garden; wages 35s. per week and lodgings. Please state age and experience.—S. MELVILLE, Stoner Park Gardens, Henley-on-Thames.

WANTED, SINGLE MAN for fine old Kitchen Garden, 17 miles, London; must be well up in the cultivation of first-class Vegetables and Fruit and to live with employer as one of family; good wages to suitable man.—Apply by letter stating age and experience to C. HART, 14, Canford Magna, Wimborne, Dorset.

WANTED, KITCHEN GARDEN LABOURER; preference given to a man with some knowledge of pruning Fruit Trees. Wife to attend to bothy; age not under 35; wages 35s. and 15s. respectively, with good cottage and garden.—Full particulars and copies of references to, F. W. GALLOP, The Gardens, Lilford, Oundle, Northamptonshire.

ELECTRICIAN - CARPENTER wanted for Farnham, Surrey; take charge of Hornsby Oil Engine and make himself useful about the place.—Miss RUSSELL, 59, Eaton Square, S.W.1.

WANTED, GARDEN LABOURER, steady, reliable man (single). Wages 30s. per week and room. State age and experience. Good character essential. — Apply, GARDENER, "Rignalls," Great Missenden, Bucks.

Myosotis (Forget-Me-Not), per doz. bun. ...	6 0–12 0	— mauve ...	6 0–8 0
Narcissus ornatus per doz. blooms	8 0–12 0	— white	6 0–8 0
		— yellow	5 0–6 0
		Violets, single, per doz. bun. ...	3 0–6 0

REMARKS.—It is difficult to quote correct prices at the time of writing. White flowers are likely to be a very moderate supply, but they will be the chief attraction to buyers during this week. Lilium longiflorum is not obtainable this Easter, therefore Arums (Richardias) will be more in demand. Roses and Carnations appear to fairly well meet the demand, but an advance in prices is only to be expected towards the week-end. French flowers are practically over, and only small consignments are expected from the Channel Islands.

Vegetables: Average Wholesale Prices.

— Belgian Gros Colmar, per lb.	10 0 —	Pears, Californian Easter Beurré, ½ case	32 0 —
Grape Fruit, pr. cse.	45 0 —	—Winter Nelis, per ½ case	32 0 —
Nuts— — Almonds, per cwt.	120 0–130 0	Strawberries, per lb.	25 0–40 0
— Barcelona, per cwt. ...	130 0–140 0	Pineapples, each	4 0–7 0

REMARKS.—English and Gros Colmar Grapes are now finished, but Belgian Grapes are still available. A consignment of Cape fruits is to hand, consisting of Black and White Grapes and Pears. Strawberries arrive daily. Californian Pears consist of Easter Beurré and Winter Nelis. Cucumbers are fairly plentiful and English Tomatos are now making their appearance. Mushrooms are a short supply, but there are increased quantities of Dwarf Beans and Vegetable Marrows. Supplies of Seakale are limited and the first consignment of Peas is just to hand. Outdoor vegetables continue to be scarce.

GARDENING APPOINTMENTS.

Mr. W. R. Taylor, after serving for nearly three years with His Majesty's Forces in France and Belgium, has resumed his duties as Gardener to T. N. LONGMAN, Esq., Shendish Gardens, King's Langley, Hertfordshire. (Thanks for 2s. for R.G.O.F. Box.—EDS.)

Mr. G. A. Funnell, recently Gardener at Lanwades Hall, Newmarket, Gardener at Brambletye, East Grinstead, Sussex.

Mr. R. Kneller, as Gardener to Colonel C. NEEDHAM, Tylehurst, Forest Row, Sussex.

Mr. A. Neal, for the past 2¾ years temporary Gardener to F. MONCKTON, Esq., Stretton Hall, Stafford, and previously Foreman at Williamston, Neyland, Pembrokeshire, as Gardener to Colonel Bellew, Casewick, Stamford, Lincolnshire. (Thanks for 2s. for R.G.O.F. box.—EDS.)

Mr. G. Taylor is leaving Byram, the seat of Sir JOHN F. RAMSDEN, Bart., after 31 years' service there, and is taking charge of Sir John's Gardens at Bulstrode, Gerrard's Cross, Buckinghamshire. Mr. A. E. Sutton, from Castle Howard, is succeeding Mr. Taylor at Byram. (Thanks for 2s. 6d. for R.G.O.F. box. EDS.)

Mr. Douglas Bath, for the past five years Foreman in the gardens at Englefield, Reading, as Gardener to Sir WILFRED PEEK, Bart. Rousden, Devonshire.

DICKSON & ROBINSON, MANCHESTER. Seed Growers and Seed Merchants. Warrant Holders to H.M. the King.

NOW IS THE TIME TO PLANT.
KELWAY'S LOVELY GLADIOLI FOR AUTUMN FLOWERS.

KELWAY'S FAMOUS GLADIOLI, planted now, produce grand spikes of glorious flowers from August until late Autumn. They are particularly useful for Church decoration during Harvest Festivals, for large Halls and Hospitals, and for decorating the Home when other flowers are scarce.

Extract from a letter from the Rev. ——, —— Rectory, Swanton Abbot, Norwich:—

11-4-19.

Dear Sirs,—I had a quantity of Gladioli of you a few years ago, and on 2 or 3 occasions in fact—and they have done remarkably well, and have been of great use for cutting for church decoration. The last 3 or 4 years I have required practically nothing else from about the middle of July to October.

They will grow in towns, and we can supply them in all colours for planting now. Do not buy Dutch bulbs but send at once for our special Price List of named sorts to the Retail Plant Department, KELWAY & SON, the Royal Horticulturists, Langport, Somerset.

SANDERS, ORCHID GROWERS, St. Albans.

BATH'S SELECT SEEDS.—New Illustrated Catalogue of choice Vegetables and Flower Seeds is now ready, and will be sent post free on application. Special terms to Allotment Societies.—(Dept. A), R. H. BATH, LTD., The Floral Farms, Wisbech.

KING'S ACRE BEDDING and BORDER PLANTS; Chrysanthemums, Begonias, Geraniums, Violas, etc. Also Choice Collection of Annuals. Price List, just issued, post free. — KING'S ACRE NURSERIES, LTD., Hereford.

CHINESE OR CELERY CABBAGE.

A VERY RAPID GROWING variety of the Cabbage tribe, but very distinct, resembling more a well-grown Cos Lettuce. It has unusual merits, and this delicious vegetable should be given a trial in your garden this season. 6d. per packet, 1s. per oz., free by post, with full directions for culture and use. —The "PREMIER" SEED CO., LTD., Seed Specialists, 117, London Road, Brighton.

Printed for the Gardeners' Chronicle, Limited, by Odhams Limited, 83-95, Long Acre, London, W.C.2, and Published Weekly by the Gardeners' Chronicle, Ltd., 41, Wellington Street, Covent Garden, City of Westminster, Saturday, April 19, 1919. Agent for Manchester, John Heywood.

PEACE!

WITH the near approach of the Peace Settlement the paper problem becomes less acute, and we are now in a position to accept more advertisements than hitherto. We shall be glad if our clients will send us their orders for a series NOW, in order that we may allocate the space. In order to prevent disappointment, those who wish for special positions will be well advised to secure them at once.

Please address all communications to;

THE

"RANSOMES"

LAWN MOWER

FIRST IN

1832

Supreme ever since.

WE are devoting all our energies once more to the production of our justly-famous Lawn Mowers, but the dislocation caused by war-work, and the consequent difficulty in obtaining materials, are taking some time to overcome. We ask you to bear this in mind when that natural disappointment comes to you when your dealer cannot supply at once. Our Mowers are the

Best in the World,

and you will find waiting for one the best policy, for a cheap, inefficient mower is an abomination.

BROCCOLI AND CAULIFLOWERS.

THE quality of Broccoli and Cauliflowers has been much improved in recent years. Many modern varieties of Broccoli are equal to the finest Cauliflowers, so that by careful selection of varieties of both Broccoli and Cauliflowers and a proper system of cultivation, an unbroken supply of these vegetables may be maintained throughout the year, provided the winter is not excessively cold. Much may be done to prevent loss among late Broccoli by carefully selecting and preparing the site on which they are to be grown. Broccoli for autumn and early winter use succeed best on deep, rich soil, but plants which are intended to stand the winter and produce a supply in spring and early summer should be planted in an open situation, where the soil is firm and not too rich, to produce plants capable of withstanding severe weather and of producing good heads during the spring. Some growers recommend planting late Broccoli on ground recently occupied by Strawberries, but although good crops may be obtained in this way it is a better practice to plant on open ground which has been prepared for them some time previously. The Strawberry plot might then be trenched and manured for a crop of early Cauliflowers. To obtain heads of Broccoli next winter and spring, seeds should be sown now; from April 25 to May 10 is a good time. At Frogmore we sow on, or about, May 10, but in late, cold districts it is necessary to sow seeds at least a fortnight earlier. Broccoli seeds should be sown thinly in shallow drills, and the bed kept quite free from weeds until the seedlings are large enough to be planted out. Planting should be done in damp weather before the plants become hard and stunted, but if dry weather sets in when the seedlings are ready to put out it is better to plant and water freely than to allow them to remain too long in the seed bed. The varieties grown at Frogmore to provide a regular succession are: Veitch's Autumn Protecting and Sutton's Michaelmas White for November and December; these varieties require rich ground and a space of 30 inches each way. For January and February, Dickson's Snowdrop, Early Market, Early Feltham, Winter Mammoth, Sutton's Christmas White, and Superb Early White are amongst the best. For March and April, use Main Crop, St. Patrick's Day, Mid Feltham and Snow White. For the latest batch, Sutton's Satisfaction, Latest of All, Late Feltham, Model, and Dickson's Victory are excellent varieties and should be planted two feet apart in an open position where the soil is not too rich but capable of producing sturdy plants. Mid-season and late varieties may be sown on the same date, but it should be remembered that in cold localities the seeds should be sown a fortnight earlier than in the south.

CAULIFLOWERS.

By careful selection of varieties, deep cultivation, a liberal use of manure in the soil, and numerous sowings, an unbroken supply of Cauliflowers may be produced from May to November. In order to produce a full supply of Cauliflowers in May the seeds should be sown in August or September, according to the locality. At Frogmore we sow the seeds as near the middle of September as possible, and winter the plants in cold pits. They are potted into 4-inch pots in November and December; if potted too early the pots become filled with roots and the plants become stunted before the time arrives for planting them in the open with safety. The varieties grown here for this purpose are Dean's Early Snowball, Great Dane, Magnum Bonum, and Early London, and these become fit for cutting in the order named. We pot about 7,000 plants of these varieties each year, winter them in frames, and plant them out at the beginning of April for early summer supplies. A close succession to the foregoing is obtained by sowing seeds of Great Dane and Early London in a slightly heated pit early in February. The young plants are pricked off into cold pits as soon as large enough and grown there until they are fit for planting in the open garden. This is, in my opinion, the most important batch, as the heads should be ready for cutting before the plantations of autumn-raised plants become exhausted, otherwise there will be a break in the succession. Another sowing made on a sheltered border in March will provide for a crop to follow very closely after Early London of the previous sowing; Great Dane, Magnum Bonum, Early London and White Queen are also suitable for this outdoor sowing. The latest outdoor sowing should be made early in May, and this should provide for supplies well into November, by which time the autumn Broccoli will be ready for use. Early Giant, Veitch's Autumn Giant, and Halloween Giant are suitable varieties for this latest sowing, and the last-named variety will last well into November as its heads are well protected from frost by ample foliage.

In all cases Cauliflower seedlings should be transplanted as soon as large enough, and never allowed to remain in the seed bed sufficiently long enough to become either drawn through overcrowding or stunted from lack of nourishment. Cauliflowers succeed best in deep, rich soil, but may be grown to perfection on light land, provided it is deeply cultivated and receives a liberal supply of manure. A mulching of manure among the plants will do much to conserve moisture in the soil and promote quick, healthy growth in hot weather. As the crop quickly suffers from lack of moisture the plantations should receive liberal supplies of water during dry periods, or early "buttoning" will be the result instead of the formation of fine heads. *John Dunn.*

THE ROSARY.

HYBRID-PERPETUAL ROSES.

THE Hybrid-Perpetual Roses, after their first introduction from France, had a very long and beneficent reign and were much more earnestly cultivated by the greatest Rosarians than the more refined Noisettes and Teas. Of late years H.P.'s have largely given place to the more fascinating class of fragrant Hybrid Teas. They are, for the most part, of comparatively easy culture and can be grown with facility in any garden that is suitable for their culture.

Such varieties as Duke of Edinburgh, Victor Hugo, and Duke of Wellington are still included in nurserymen's catalogues, and I also retain these veterans in my collection, and sometimes imagine that even by some of the grandest modern "crimsons" they have not been entirely superseded. These, after all, were the Roses that laid the bright foundation of our finest modern acquisitions; and I question very much if the venerable General Jacqueminot, which still flowers profusely in gardens, has not been the original or chief progenitor of them all.

I well remember that the late Mr. William Paul, of Waltham Cross, always declared that Duke of Edinburgh was raised, in his earlier days at Cheshunt, from a seed of General Jacqueminot.

Another eminent Rose, whose descendants have been numerous beyond enumeration, is Baroness Rothschild, and its first notable production, a Rose which, initially, made a great sensation, was the beautiful, scentless Merveille de Lyon. Many of the finest of the old Hybrid Perpetuals are still assiduously cultivated in modern gardens.

Conspicuous among these are A. K. Williams, which had a long reign among its dark-crimson contemporaries as an exhibition Rose; Charles Lefevre, which was a supreme favourite of Dean Hole; Duke of Edinburgh, already characterised; Duke of Wellington, Dupuy Jamain, Horace Vernet, and the luminous Fisher Holmes.

Among crimson Hybrid Perpetuals of comparatively recent origin, few are more grandly effective than Captain Hayward. General McArthur, Salamander, Crimson Emblem, Admiral Ward, and H. D. M. Barton; while, among the most entirely reliable and highly ornamental white Roses within the range of my acquaintance, two of the finest are Snow Queen and its presumable derivative, Candeur Lyonnaise, Roses of almost peerless beauty, whose scentless character is their one great limitation. But so commanding is their impressiveness that they are invaluable for exhibition. Maharajah is a fascinating variety, with large, single, dark-crimson coloured flowers; David R. Williamson is a richly fragrant variety, of exquisite carmine-rose colour, which has been very popular, especially in England. Other Hybrid-Perpetuals of various and distinctive colours that may be highly commended are: Mrs. John Laing, Mrs. R. G. Sharman Crawford, Suzanne Marie Rodocanachi (rosy cerise); Hugh Dickson, perhaps the most beautiful of all bright crimson Roses; Commandant Félix Faure, which is always finest in early autumn; Ben Cant, Marie Baumann, Alfred Colomb and Merveille de Lyon. *David R. Williamson.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUMS FROM MESSRS. J. CYPHER AND SONS.

The value of Orchids for cut flowers has been demonstrated in a higher degree during the war than at any previous time, and throughout the long period when the sale of plants was restricted many Orchid growers found some return in the sale of their blooms.

Messrs James Cypher and Sons, Exotic Nurseries, Cheltenham, one of the oldest Orchid-growing firms who make a business of the sale of rare and well-grown Orchids, as well as a decorative branch in which Orchids and especially cut blooms, are extensively used, write saying that the cut flower business has been more than usually satisfactory this year, and praising the Dendrobiums so extensively grown by them. These Orchids have given a wealth of bloom for some months past, and they have sent us a box of very handsome examples representing the types at present in fine condition.

CULTURAL MEMORANDA.

THE CULTURE OF THE RAMONDIA.

A considerable number of cultivators of Alpine flowers—and these not always novices—appear to experience considerable difficulty in growing Ramondias in a satisfactory manner. From hearsay or from one or two experiments they have acquired the impression that these attractive Alpines are troublesome—though this is not true. Given conditions in which they can obtain their few necessities, they will seldom fail to give satisfaction, and their demands can usually be supplied in most gardens where they are desired.

One of the most important details in the successful cultivation of the Ramondia is shade. Being natives of sunless—or almost sunless—gorges, the Ramondias have little liking for the direct rays of the sun. If fully exposed to these they are easily shrivelled and seared as if by fire, and shade is necessary to secure their welfare.

Fig. 93.—Ramondia serbica (syn. Nathaliae): flowers pale mauve.

The numerous varieties of Dendrobium nobile are favourites with growers, their blooms varying from the pure white D. nobile album to the large, rich vinous-mauve of the true D. n. nobilius, which in most respects is still one of the best coloured forms. D. n. elegans, D. n. Cypher's variety, and D. n. Heathii, are other desirable plants. Forms of the D. Ainsworthii class are represented by D. Ainsworthii Bilney's variety, a large, cream-white flower, tinged with rose and having a dark purple eye; D. rubens magnificum, one of the largest forms, with petals tinged with mauve, and D. Apollo grandiflorum, a large bloom of fine shape. The charming D. Cybele (Findlayanum x nobile) is represented by D. Cybele giganteum, the largest coloured form, and the rare and chaste pure white D. Cybele album. D. lituiflorum, a pretty species that is becoming rare, has neatly-formed mauve-tinted flowers produced on slender pseudo-bulbs. Dendrobium Thwaitesiae Veitch's variety, is the finest rich yellow variety of its class, the spray of three flowers bearing large, rich orange yellow blooms, with dark maroon disc to the lip. D. Rolfeae, a compact and pretty flower, and other hybrids were also included.

Many years ago, when Ramondia pyrenaica (see Fig 95) was coming into favour, and doubts were expressed as to the proper conditions it required, I saw a large number of the plants in a hardy plant nursery. They had been established in pots for sale, and were growing admirably on a stage with an impromptu pavilion composed of thick cheese cloth to supply shade from the sun. The result was excellent, and an object lesson was afforded to all who saw the plants. A year or so afterwards, on visiting the garden of the late Rev. C. Wolley Dod at Malpas, Cheshire, a flourishing group of Ramondias was seen on a little bank sloping gently to the north and with a low screen of sheet iron between the plants and the sun. The owner, in his time one of our best hardy plantsmen, was justly proud of the success of his Ramondias, and emphasised the point that shade was essential for these flowers. I have seen Ramondias in many conditions since, and have experimented not a little with them. My conclusion is that this question of shade should be placed in the forefront of the conditions required.

Another desideratum is moisture. This need not be excessive, but its absence leads to a sickly condition on the part of the plants, which shrivel badly, and although they respond wonderfully to a supply of water artificially applied, this is sometimes neglected, and the plants eventually succumb if great care is not taken of them. It has been advanced that the shrivelled leaves of a Ramondia soon swell and recover their former healthy appearance after being supplied with water, but it is obvious that the plant must have been suffering and could not fail to be weakened by its ordeal. These two points seem to be more important for the Ramondias than that of soil. The plant is not difficult to cultivate in ordinary garden loam, and the compost may vary considerably. Loam, leaf-soil, sand, and grit have been recommended, as well as loam and peat.

Shade and moisture may best be secured by planting the Ramondias on the north side of a rock garden or a wall. In the former situation it is not difficult to secure the necessary conditions. In a wall garden it is more difficult, unless the wall is a retaining one and well supplied with moisture. Where the plants are self-grown ones, such as are sometimes found in an old mortar building, the roots penetrate between the crevices of the stones and suffer less than those planted in similar positions. On a properly built retaining wall, where the stones are laid so that the rain can enter between the joints, the supply of moisture is generally sufficient, but sometimes the ground behind a retaining wall is too dry for the welfare of the Ramondia. On a northern exposure, such as these plants have in Sir Herbert Maxwell's garden at Monreith, no difficulty is experienced.

These remarks are the result of considerable experience in the cultivation of the Ramondias as represented by R. pyrenaica, R. serbica (syn. Nathaliae; see fig. 93), and the other species or varieties of this charming genus of rock or wall plants. *S. Arnott.*

THE ALPINE GARDEN.

CORTUSA MATTHIOLII.

This old plant, known as the Common Bear's Ear Sanicle, is a native of Italy, Siberia and Austria, and has been in cultivation in this country since 1596, at least, and may have been introduced even before that date. Matthioli, in his Commentary on Dioscorides, gives a figure and description of the species, and tells a good deal about the plant. It is frequently figured in more recent garden literature, but is not now a common subject in cultivation. It does not, however, deserve to sink into oblivion, although its near allies, the Primulas, far eclipse it in attraction and intrinsic beauty. The plant grows from eight inches to ten inches high, and has prettily lobed leaves and umbels of drooping, deep purplish-crimson flowers in April, May and June. Its cultural requirements are shade, shelter from cold winds, and a moist soil. Peat is preferable, but the plant will grow well in a mixture of loam, leaf-mould and sand. Propagation is effected by division or seeds. In cold districts it is advisable to give the plant protection in winter, especially of a kind to throw off heavy showers of sleet and rain, from which it suffers even more than from frosts. *S.*

FLORISTS' FLOWERS.

VERBENAS.

The Verbena about the middle of the last century and for long afterwards was exceedingly popular, both as a bedding plant and also for exhibition purposes. As illustrating the extent to which the plants were then cultivated, and also serving to show their hold on the public, it may be mentioned that in the list of plants certificated from 1859 to 1893 issued by the Royal Horticultural Society, more than 100 first-class certificates are recorded as awarded to garden varieties of Verbena. The greater number of these awards were made in the '60's, when Verbenas were largely grown for exhibition purposes. With regard to the R.H.S. list of certificated plants it may be noted that in the last

THE FERNERY.

THE BRITISH SHIELD FERNS.

The following article on Polystichum was sent us by the late Mr. C. T. Druery just before his death.

To those who possess conservatories small or large which are attached to the dwelling house in such a way as to be largely shaded thereby, and consequently handicapped for successful flower cultivation owing to the absence of bright sunshine, no plants can be more highly recommended than our native Shield Ferns, or Polystichums, and particularly their varietal forms. In the very many wild "sports" which have been discovered by those who make a hobby of Fern hunting, Nature has supplied abundant material, not only in the form of varieties which are far and away more beautiful than the common or normal types, but she has also endowed these with a capacity for such further improvement of type that in these days we have hundreds of forms well worthy of places of honour even in the conservatories of the most exacting connoisseurs of plant beauty. Amongst the three species indigenous to Great Britain and Ireland—viz., P. Lonchitis, P. aculeatum, and P. angulare—the first-named is so rarely successfully grown and has varied comparatively so little that we prefer to dismiss it and only to deal with the other two. Of these two, it is undoubtedly P. angulare, or the Soft Shield Fern, which has been the most liberal in its wild "sports." Of these P. proliferum has for many decades been a popular Fern for the decoration of dwelling rooms and conservatories. This differs from the normal, twice divided specific form in having its sub-divisions much more numerous, slender and acute, giving the fronds almost a mossy aspect, but it is further distinguished by the faculty, as its name "proliferum" implies, of producing considerable numbers of plantlets along the stalks, and in the axils of the pinnae or side divisions. By layering these it is very easy to increase the stock, and it is doubtless this fact which has contributed largely to its popularity and wide distribution by traders. It has, however, been found that not only a number of distinct proliferums have been discovered with a like faculty, but that many other varieties have a like tendency, though on a less liberal scale, the little plantlets or bulbils only occurring near the frond bases. These, if left alone, are apt to root into the soil, and so provide lateral offsets, though the family generally is far more prone to remain as single crowned plants than many other species.

Polystichum angulare is evergreen and hardy, and under glass protection retains its frondage through the winter and until the next season's fronds are well in evidence. Good, open leafy compost or good ordinary garden soil suits this Fern well, so that it is by no means difficult of cultivation. In the open garden, in a position not too freely exposed to sun and wind, the various types of this Fern make magnificent specimens, varying in size according to their varietal character, from five feet or more across to dwarf gems less than a foot in diameter.

The handsomest forms by far are those known as plumosums or divisilobums. In these the fronds, instead of being only twice divided into mitten-shaped lobes, like a fingerless glove with the thumb nearly at right angles, may be thrice or even four times divided; as these divisions are very slender and considerably lengthened, the fronds are of a densely mossy nature. Of this section there is now, thanks to selective cultivation, a considerable number, but the best are known as the Jones and Fox divisilobed plumosums, densum, laxum, robustum, and last, but not least, "Baldwinii" In addition to these, and on similar lines, and quite possibly of similar origin, there are Esplan, Pearsonii, Grimmondii, and plumosissimum (Birkenhead), the last a perfect marvel of dissection, but extremely difficult to grow to perfection. With the others, however, with proper treatment as regards watering and planting in suitable situations, there is no difficulty in their cultivation. All these forms are due to selection, but there are several "plumosums" which were found wild—viz., Moly's, Patey's, and Wallaston's, which, however, are not dissected to the same extent as the others, but are nevertheless very pretty. The crested or tasselled section of the species embraces a number of very pretty forms, in which the form of the tassels varies greatly from bunch or corymbiforms to flat or fan-like ones; while with these there are associated an almost infinite amount of variation in the forms of the ultimate divisions, pinnules, pinnulets, and so on, some being blunt and rounded, some very long and acute, and all graded between with varied habits of growth and, as already indicated, of size, some being lax and slender and spreading, and others densely congested. The majority of these forms are symmetrical in growth and handsome. So beautiful, indeed, is the family as a whole in its varietal capacity, that it is a saying amongst British Fern lovers that everyone who takes up the cult as a hobby is bound eventually to become a Polystichum lover in particular.

P. aculeatum, of tougher character and with somewhat lucent frondage, is specifically distinguished from P. angulare by the fact that the mitten-shaped sub-divisions aforesaid have wedge-shaped bases and are attached to the stalk by the point of the wedge and not by a distinct stalk, as is the case with P. angulare. In P. aculeatum we have some very finely tasselled varieties, and others in which the sub-divisions vary in shape considerably. It is of stiffer habit, and forms handsome specimens. The "grandiceps" forms of Talbot and Abbott bear heavy terminal crests of great size. P. aculeatum has distinguished itself specially by yielding the unique "gracillimum Druery" and "plumosum Green" sections of very beautiful forms, of which the former has no parallel, while the latter imitates closely the plumose "divisilobums" of P. angulare above mentioned in delicacy of cutting. Despite the great difference between these two sections, they both arose from one sowing from a very beautiful wild "find" named "pulcherrimum," which had been reputed as barren for nearly forty years, but on which closer investigation eventually disclosed a few spores.

[In Fig. 92 we illustrate the beautiful P. a. pulcherrimum Drueryi, which received the R.H.S. First Class Certificate on October 1, 1907.—Eds.]

Fig. 92.—Polystichum aculeatum var. pulcherrimum Drueryi.

water to settle the compost, and keep them rather dry afterwards until the roots are growing freely; they will then require a very liberal supply of water all through the growing season. Cool, airy quarters, in a light structure, suit this Orchid, but newly-potted plants may be put into rather closer quarters for a time, and afforded a little extra shade until they are re-established. They need a moist atmosphere, and unless this is provided they are subject to attacks of red spider.

Ada aurantiaca.—This fine old Orchid should find a place in every collection, as it has bright flowers and blooms freely. It is, moreover, fairly easy of culture, requiring to be grown in a pot with good drainage, good peat fibre and Sphagnum-moss. The materials should be used in as rough a state as possible, according to the size of the pots employed, so that the large quantities of water required during the summer months will not render the material sour. The best time to give these plants new rooting material is shortly after flowering, when new roots are pushing forth from the last made growths. Ada aurantiaca will grow well in the cool house, but it succeeds best in a rather warmer temperature, such as the cool-intermediate house affords, and especially during the winter months. It likes a shady position, and newly potted plants will need extra shade and careful watering for a time.

THE HARDY FRUIT GARDEN.

By James E. Hathaway, Gardener to John Brennand, Esq., Baldersby Park, Thirsk, Yorkshire.

Pollination of Fruit-tree Blossoms.—Owing to the loss of many bees through the Isle of Wight disease, pollination of fruit blossoms should receive attention. Bees are a valuable help in fertilising flowers, and no large fruit garden should be without them if they are to be procured, for bees are worth keeping for this purpose alone. As a rule, outdoor fruit blooms do not need much help in this matter, especially if the weather is warm and favourable for pollen distribution, and bees are kept; but where there are no bees it is a good plan to give the trees a gentle shake or tap the branches of flowers with a stick bound round with a piece of cloth. On bright, hot days it is a good plan to lightly spray the blossom with clean water, in the form of a very fine mist; just sufficient to disturb the pollen is all that is needed.

Vines on Walls.—Outdoor vines should be disbudded; it is surprising what good Grapes may be grown on warm walls if the vines are properly attended to. Extend the growths evenly over the wall and avoid overcrowding. As soon as growth is vigorous all lateral shoots should be pinched to one eye and the fruiting shoots should be shortened to three or four joints beyond the bunch. One bunch only should be allowed to each shoot. As soon as the shoots are large enough secure them firmly to the wall, taking care to leave plenty of room for the stem to swell. Where old vine rods are getting worn out strong, young shoots should be selected and trained up to replace them. See that the vines receive plenty of water in dry weather, and give them liquid manure at least once a week, or a dressing of some good fertiliser. As soon as the fruit is set syringe the vines night and morning. A good mulching of decayed farmyard manure should be placed over the roots, as vines like plenty of manure; the layer of dung should not be so thick as to exclude the air, nor should it be of a wet, sloppy nature.

Peach Trees.—Trees heavily laden with blossom buds should be relieved of some of them, removing, as far as possible, all buds nearest to the wall and leaving the bulk for fruiting on the side exposed to the sun.

Aphis on Fruit Trees.—All kinds of fruit trees should be carefully watched now for any signs of green or black fly, for if once allowed to establish themselves these pests cause considerable trouble. Where these insects are found the trees should be at once syringed with quassia extract or some other suitable insecticide.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford. Wrotham Park, Barnet, Hertfordshire.

Use for Forced Bulbs.—Old Daffodil bulbs that have been lightly forced under glass should be planted out of doors either in grass near deciduous trees, in the semi-wild garden, or other suitable places. In planting, see that the soil is broken up to a reasonable depth and enriched with manure. The old bulbs of Tulips and Hyacinths that have been forced may also be planted in suitable places, where they will grow and flower freely for several seasons without further attention.

Sweet Peas.—Seedlings raised in pots should be planted out in deeply dug and thoroughly prepared soil. Stake them at once, and, should keen winds prevail, place a few Laurel branches along the sides of the rows. Always stake Sweet Peas early, keep the soil about the plants well dusted with soot, and allow ample room between the clumps.

Chrysanthemums.—All early flowering Chrysanthemums that are to flower out of doors should at once be planted in suitable positions, allowing them ample space for development. The soil should be deeply cultivated and well enriched with suitable manure.

Hyacinths.—The Hyacinths will need supports to keep the trusses in an upright position. Keep the soil around them free from weeds and stir the surface at intervals. See that all the varieties are correctly named and make notes of the most useful sorts for another year's planting.

Tulips.—Where May flowering Tulips have been planted for the production of late flowers, stir the soil amongst them, both to encourage growth and to destroy small weeds. Should dry weather set in, give the beds a thorough soaking with liquid manure, or a dressing of some good artificial fertiliser.

Polyanthuses and Primroses.—In order to work up a healthy stock of Polyanthuses for spring flowering, seeds of suitable varieties should be sown in pans, or in cold frames; any fairly good soil of a sandy nature pressed firmly will serve as a seed bed. Sow the seeds thinly, and when the plants are large enough lift them carefully and transplant them a couple of inches apart in boxes or frames, removing them later to a well-prepared border.

Sunflowers.—Sow Sunflower seeds where the plants are intended to flower. Do not plant the seeds too deeply. Support the plants early, and feed them liberally in dry weather.

PLANTS UNDER GLASS.

By James Whytock, Gardener to the Duke of Buccleuch, Dalkeith Palace, Midlothian.

Cyclamen.—Seedling Cyclamens are growing freely, and may be shifted into slightly larger pots. The soil for this potting should consist of two-thirds loam and one-third leaf-mould, with sand and small pieces of charcoal added. Place the plants in a warm house, arranging them on a rough, moist bottom. Shade from bright sunshine and syringe the plants daily. Fumigate the house occasionally to keep down insect pests.

Cytisus and Genista.—All Genistas and Cytisus which have passed out of flower should be pruned into shape, placed in a temperature of 55° to 60°, and syringed on bright days. When they have made good growth, place them in a cool house, preparatory to plunging them outdoors in a bed of ashes for the summer months. Cuttings may be inserted singly in small pots, placed in an intermediate house, covered with a bell glass, and shaded from the sun until rooted.

Violets.—Where a supply of Violets in frames is required throughout the winter, preparation should now be made for planting young stock, rooted last autumn, or produced by the division of old plants after flowering. A border under a wall, with a north aspect, or soil in any situation shaded from sunshine, should be deeply worked and heavily manured for the plants. The single varieties grow stronger than the double ones, and should be planted at a greater distance apart. Care must be taken not to let the roots get dry, and if the plants are troubled with red spider, spray them at the close of bright, sunny afternoons, with weak, liquid manure from the cowshed.

Various Cuttings.—With a view to having plants of sufficient size and usefulness for flowering in winter, cuttings should now be inserted of Eranthemum pulchellum, Thyrsacanthus rutilans, Plumbago rosea, and Salvias. Use 60 sized pots filled with a mixture of loam, peat, leaf-mould and sharp sand, insert the cuttings and place them under a bell glass or frame over bottom heat until rooted, then remove them to a shelf near the roof glass in a warm house and keep them well watered. Cuttings of Fuchsia and Heliotrope inserted now will make useful decorative plants by the autumn.

Gesnera.—Re-pot the tubers in well-drained pots in a mixture of peat, leaf-mould, dry cow manure and sharp sand; grow them in a moist, warm atmosphere, and afford them very little water until they commence to grow, when a thorough watering may be given. To prevent injury from insect pests fumigate the plants occasionally.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Cauliflowers.—Seedling Cauliflowers growing in pots and frames need liberal applications of diluted liquid manure from now onwards, and daily syringing with clear water when closing the lights. Prick off plants from later sowings when large enough to handle.

Leeks.—Seedling Leeks that are well established either in pots and boxes may, when suitably hardened, be transferred to their final quarters. Prepare trenches one foot in depth and the width of a spade; break up the bottom soil, and on this place a layer of short manure to the depth of 6 inches. Cover the manure with 5 inches of prepared compost consisting of loam 3 parts, manure from a spent mushroom-bed, leaf-mould, and grit one part each. Make the soil firm, and plant the Leeks with great care in single lines at 1 foot apart. In hot, dry weather water the plants, and syringe them daily when necessary. Good varieties are Prizetaker, Lyon, and International.

Cabbage.—The long, trying spring, with much rain, has not suited this important crop. When the surface soil is in a workable condition, use the hoe often. Dress the ground between the rows with sulphate of ammonia, and occasionally with soot, and work these fertilisers well into the soil. This treatment will promote a rapid growth from now onwards. Young plants raised in boxes for succession may be planted out in rows made 18 inches apart, allowing a distance of 1 foot between the plants in the rows. Make another sowing of Cabbage on a sheltered border, choosing an early variety such as Early Favourite or Tender and True.

Beet.—A sowing of early Turnip-rooted Beet may be made with safety now in a sheltered border. Sutton's Globe is an excellent variety, of dark red colour when cooked. Sow in shallow drills 1 foot apart, and watch closely for birds when the seeds are germinating, or the crop may be quickly spoiled.

Mushrooms.—If it is possible to obtain fresh horse droppings in a short space of time, a Mushroom-bed may be made at the foot of a wall facing north, to provide Mushrooms during the summer. The manure should be turned every second or third day. When the temperature of the manure has fallen to 78° make up the bed firmly to a depth of not less than 15 inches. Break the spawn into 4 inch squares, and insert the portions 2 inches deep at 1 foot apart. Cover the surface with finely sifted loam to the depth of 1 inch, make this firm with the back of a spade, and cover with long litter.

list, which carries the record down to the year 1910, many of the commoner kinds of garden flowers are omitted. For instance, there are only five Verbenas named therein, all of which obtained Awards of Merit. The same is true of Pelargoniums, Fuchsias, Petunias, and other florists' flowers. This omission is thus alluded to in the latest list. "In the following pages will be found a list of all the plants, flowers, fruits, etc., to which the Council have granted Certificates on the recommendation of these several committees or otherwise, from the year 1859 to the end of 1910, with the exception of purely florists' flowers certificated previous to 1890, many of which, having been superseded and become obsolete, are omitted from this list. They will, however, be found, if wanted, in the previous lists published in 1894 and in 1900."

Old time nurserymen's catalogues are often interesting reading, and in that of the then prominent firm of E. G. Henderson and Son, Wellington Road, St. John's Wood, for the year 1866, no fewer than 28 new varieties are listed, seven of them being announced as exhibition varieties, the others being recommended for bedding. It may be noted that the exhibition kinds are priced at 5s. each, and the bedding ones at 3s. 6d.

Again, in the catalogue of Philip Ladds, then of Bexley Heath, for the year 1868, no fewer than 52 varieties are quoted, but at a very much cheaper rate than those above referred to. A dozen of them are described as new, Italian, striped varieties. The chief English raisers were Mr. C. J. Perry, of Castle Bromwich, a very successful exhibitor of the Verbena; Mr. Eckford, afterwards prominently identified with the Sweet Pea; Messrs. Henderson, above referred to; Mr. John Wills, then manager for Mr. J. W. Wimsett, Ashburnham Park Nursery, Chelsea; and Mr. H. Cannell, of Woolwich. The advent of the new varieties issued by these raisers was annually awaited with interest far greater than most gardeners of the present day can understand. *W. T.*

TREES AND SHRUBS.

SALIX SALAMONII.

As a watrside tree this Willow deserves a more extended notice than it has yet received, especially in localities too inclement for S. babylonica. It is a hybrid between that species and our native white Willow, S. alba, and whilst it is not so pendulous in habit as S. babylonica, it is extremely graceful, and has inherited the greater hardiness of the other parent. It is also a more vigorous grower than S. babylonica, and this has led to its being planted extensively on the Continent, in the north-central parts of which that species is not hardy. S. Salamonii is said to have originated on the estate of Baron de Salamon, near Manosque, Basses Alpes, more than fifty years ago, and it was first put into commerce by the firm of Simon-Louis of Plantières, near Metz, in 1869. The illustration in Fig. 94 is of a tree growing by the side of the lake at Kew, where there are also several others.

FIG. 94.—SALIX SALAMONII GROWING BY THE LAKESIDE AT KEW.

The specimen figured is 50 to 60 feet high. The leaves are brilliant green above and glaucous beneath. On first expanding they are clothed with silky hairs, especially beneath, but these soon fall away leaving the surfaces as smooth as those of S. babylonica. Another quality of S. Salamonii is that the foliage is retained until December. The photograph was taken late in October, when the common Oak had dropped most of its leaves. Notwithstanding this fact, it is one of the earliest trees to burst into leaf in spring; thus there are few genuinely deciduous trees that are in full foliage during so many months of the year as this Willow. *W. J. Bean.*

Spring Horticultural Exhibition in Paris.—The Spring Horticultural Exhibition which is being arranged by the Société Nationale d'Horticulture de France is to take place at Cours-la-Reine from June 5 to 9. The exhibition promises to be interesting from many points of view.

The Week's Work.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to Major J. A. Berners, Woolverstone Park Gardens, Ipswich.

Late Vineries.—On vines in successional houses, reduce the bunches to the required number and thin the berries. Free-setting varieties should be attended to directly the berries begin to swell, otherwise it is very difficult to thin them without causing injury. Tying out the shoulders tends to form shapely bunches, and when this is done very little thinning is required. After the berries have been thinned once, subsequent thinnings are necessary only to remove seedless berries and others that are crowded. Sudden outbursts of sunshine after a dull spell are liable to scald the foliage; to prevent this danger admit air early in the mornings directly the temperature begins to rise, increasing the amount of ventilation gradually as the temperature rises, so that by the time the sun has sufficient power to cause scalding excessive moisture on the foliage is dispersed. Vines which are in full flower should have plenty of air whenever it is possible to open the ventilators freely without danger from cold draughts. To assist the berries to set give the rods a sharp shake two or three times during the day; shy setting varieties may be assisted by tying the bunch point upwards and placing on one side any leaves which hinder the free access of sunlight. Endeavour especially to secure a good set of berries on the shoulders of the bunch setting well, otherwise a shapely bunch cannot be produced. On bright days damp the paths, walls and borders during the afternoon and again the last thing at night.

Melons.—The fruits on plants raised from seed sown last December are rapidly approaching the ripening stage, and a drier atmosphere is necessary to develop their full flavour. Admit air freely on every favourable occasion, for if the house is kept too close there is a likelihood of the fruits cracking badly. The supply of water to the roots should be considerably reduced. Cut the fruits at the first sign of cracking at the stem. After being cut, the fruits will attain a better flavour if kept for three or four days in a warm, dry place. Successional fruits are swelling rapidly under the influence of increased sunshine. If the rooting area is restricted, feeding must be on a liberal scale until the fruits attain their full size, and the more frequent the change of food the better will be the progress and the finer the fruits. The temperature at night should range from 65° to 70°, and by day from 80° to 85°, and 90° to 95° after closing the house with sunheat and giving a thorough syringing. All laterals should be pinched at one or two leaves beyond the fruit; remove all useless growths, and carefully preserve the principal leaves. As the days lengthen allow an increase of temperature at all times when air may be admitted freely.

THE ORCHID HOUSES.

By H. G. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Anguloa.—The present is a good time to examine and repot any Anguloas that are not likely to flower, provided they need this attention. Those that are going to bloom (as indicated by the swelling of the flowering growths) should not be disturbed until the period of flowering is over. Anguloas need ample drainage, and a free, open compost made of two parts each of the best fibrous loam and peat (or Al fibre), and one part well chopped Sphagnum moss, with a liberal addition of crushed crocks and charcoal. Use clean pots, make the rooting material moderately firm about the roots, and keep the base of the plant a little below the rim of the pot. A few days after repotting, give the plants one good soaking of

of houses, hostels, workshops, and other buildings. The design shows a grand avenue, facing on to Lancaster Castle and parish church at one end, and on to a new church to be built at the other, and it is expected the corporation will construct a new road connecting the village and the district in which it is situated with the town. The village is intended to be a memorial to the Lancaster men of all regiments, and of Lancaster sailors and Service men of all kinds, who have fallen in the war. The scheme has thus taken definite shape. Several cottages have been promised, and the subscribers to the Royal Lancaster Prisoners of War Fund have voted £2,500 from their surplus funds to build five cottages and £250 towards the Lord Roberts Workshop. Other Lancastrians have promised one or more cottages. It was recently announced that the estimated cost of the village to voluntary subscribers would be about £23,000 or £25,000, other sums being payable from public sources.

Chrysanthemums from Ardencraig, Rothesay.—Few floricultural or botanical curiosities which reach the Editorial offices of this paper occasion us much surprise, and it is no new experience to receive flowers blooming extraordinarily out of season; but we confess to some surprise when opening a box of Chrysanthemum blooms on Thursday, the 17th inst., to find really good, substantial and long-stemmed flowers of the variety Mrs. J. J. Thornycroft, which would have realised from 6d. to 1s. each in Covent Garden Market, judging from the prices paid for white flowers. The Chrysanthemums were sent by Mr. J. Davidson, gardener to Sir John Reid, Ardencraig, Rothesay, who also kindly sent the following note:—

I am sending for your inspection, by post, a box of Chrysanthemum blooms, variety Mrs. J. J. Thornycroft, which I think are fairly good for the time of year. We maintain a large supply of cut flowers all the year round, and Chrysanthemums are our mainstay for the winter season. We begin to cut Chrysanthemums at the beginning of August, and continue until the end of March, but this year the blooms are a little later, and we shall be cutting until the end of April. It is wonderful how large and continuous a supply of good cut flowers can be maintained after one has had a little practice and some experience of the local climatic conditions. Chrysanthemums, Narcissi, the longer-stemmed Tulips, Sweet Peas and various other subjects are all available in their season. As in many other establishments we have been very short handed for the past few years, but we have managed to keep things going by extra work and care and now look forward to better times.

Sea-Algae as Fodder for Horses.—A French professor (M. Lapicque) has lately presented to the Académie the result of some experiments which have been carried out in regard to the food value of certain sea-water Algae, of which the most suitable appears to be Laminaria flexicaulis. Monsieur Lapicque states that this Alga has been fed to army horses, and has been found to contain considerable nutritive value. He points out, however, that the excessive washing which was at first thought necessary in order to get rid of the hygrometric salts is disadvantageous in that it washes away also the nutritive sugar. It has now been found that the best plan is to gather the Alga in August and September, plunge it for a quarter of an hour in weak lime-water (four or five grammes of lime to a litre of water), then rinse it for a quarter of an hour in soft, clear water, and dry it in the open air. After this process the injurious salts disappear, and the fodder can be kept like hay.

FIG. 95.—RAMONDIA PYRENAICA: FLOWERS PALE PURPLE.
(See p. 201.)

Nitrate of Soda.—The Minister of Munitions announces that the control of nitrate of soda will be suspended as on and from May 15. General licences will, however, be issued until that date authorising dealings in nitrate of soda, but such licences will not authorise the holders to enter into any transaction which involves the actual movement of nitrate except within the British Isles before May 15. All applications for licences should be addressed to the Ministry of Munitions (Department of Explosives Supply), Storey's Gate, S.W.1.

New Orders Concerning Copper Sulphate and Blast-Furnace Flue Dust.—The Ministry of Munitions has issued the following Order with respect to Copper sulphate. "With reference to the following Order made by the Minister of Munitions, namely: The Copper Sulphate Order, 1918, dated February 15, 1918, the Minister of Munitions hereby orders as follows:—(1) The operation of the said Order is hereby suspended on and after April 15, 1919, until further notice. (2) Such suspension shall not affect the previous operation of the said Order or the validity of any action taken thereunder, or the liability to any penalty or punishment in respect of any contravention or failure to comply with the said Order prior to such suspension or any proceeding or remedy in respect of such penalty or punishment. (3) This Order may be cited as The Copper Sulphate (Suspension) Order 1919. A new Order dealing with blast-furnace flue-dust is as follows:—In reference to the following Order made by the Minister of Munitions, namely: The Blast-Furnace Dust Order, 1917, dated August 7, 1917, the Minister of Munitions hereby orders as follows:—(1) The operation of the said Order is hereby suspended on and after April 30, 1919, until further notice. (2) Such suspension shall not affect the previous operation of the said Order or the validity of any action taken thereunder, or the liability to any penalty or punishment, in respect of any contravention or failure to comply with the said Order prior to such suspension, or any proceeding or remedy in respect of such penalty or punishment. (3) This Order may be cited as The Blast-Furnace Dust (Suspension) Order, 1919."

Anti-Rat Campaign.—Although action under the Rats Order, 1918, is not yet so general or drastic as might be desired, many of the County Councils are moving in the matter, and there is a growing recognition of the seriousness of the problem. In many counties the action taken by the Council is restricted to offering a reward for the bringing in of dead carcases, the price paid ranging from 1½d. to 3d. Buckinghamshire, Shropshire, Staffordshire, Derbyshire, Middlesex, Oxfordshire, Rutland and other counties offer 2d. per rat; Worcestershire will pay 2s. per dozen for rats' tails. The County Council of Anglesey pays 1½d. per rat's tail produced, and from January 25 to March 31 19,691 rats were destroyed under this arrangement. Carmarthen also offers 1s. 6d. per dozen for rats' tails, work under the Order being carried through by the police. This is a temporary scheme which will be run for three months pending the consideration of further measures. In the Isle of Wight and Leicestershire the price is 3d. per rat. In the area last mentioned in eight weeks 29,378 rats had been slaughtered at a cost of £367 4s. 6d. West Sussex has given trial to a reward scheme which began on December 1. Up to March 9 29,762 rats had been accounted for at an expenditure of £367 1s. 9d. Whilst the principle of making payment does some good by providing an incentive to kill rats it does not bring about that thorough and systematic destruction over wide areas which is necessary to ensure satisfactory and lasting results. For this reason reliance upon reward schemes alone cannot be regarded as sufficient. In East Sussex an Executive Officer to supervise rat destruction has been appointed and similar appointments have been made in Hampshire and elsewhere. Kent, Lancashire, Monmouth and Somerset are among the counties now considering the question of making such appointments. Cornwall is employing poisoners at 32s. per week. The Hereford Council have granted £400 to be used by the War Agricultural Executive Committee for the destruction of rats; Devon has voted £1,000 and operations are being carried out in experimental areas, and Glamorgan is devoting a similar sum to selected districts. The Surrey Council will consider a scheme shortly formulated by the War Agricultural Executive Committee. In East Suffolk, where rat destruction has since the outbreak of human plague in 1910 been energetically carried out under the direction of the Local Government Board, the Rural and Urban District Councils are offering rewards ranging from 1d. to 2d. per rat killed, and in some cases have engaged rat catchers.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 49.2°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday*, April 23, 10 a.m.: Bar., 30.2; temp., 56°. Weather—Fine.

Rubus Barkeri. An account of the remarkable behaviour of Rubus Barkeri Cockayne was given in *Gard. Chron.*, November 19, 1910, p. 374, in which the record of this species in failing to flower was described, and the conjecture of Dr. Cockayne that it might prove to be a non-flowering species was reviewed. Now, after a period of about nineteen years since R. Barkeri was brought into cultivation, the same author records* that its reluctance to blossom has lapsed, and that a specimen grown in the garden of Mr. D. L. Popplewell, of East Southland has produced a panicle of five flowers, which with the exception of one stamen in one of the flowers are all female, whence it is to be inferred that the species is dioecious.

The fact that flowering has only occurred after so many years might perhaps be taken to indicate that the original cuttings were taken from a juvenile and not from an adult plant; but the evidence, based on thickness of the stem and size of the plants, is all against this view. We are therefore driven to conclude that Rubus Barkeri, though capable of bearing blossom, is in fact a shy flowerer, that is to say, that it requires special and apparently unusual conditions before it is able to pass from the vegetative to the reproductive stage. The curious facts discovered by Dr. Cockayne with respect to this Rubus, only serve after all to remind us of our ignorance of the special conditions which determine whether a plant or a bud shall remain vegetative or become floriferous. The recurrent and at times sporadic formation of fruit buds in the case of fruit trees is a case in point. The gardener has done his part in observing the general conditions which make for or against fruitfulness. In ascribing a large influence to the extent of "ripening of the wood," he—without doubt correctly—realises that the nature of the bud of this spring was determined, perhaps irrevocably, perhaps only conditionally, by the weather and the state of the tree in the autumn of the preceding year. It remains for the botanist to explore this subject further, not only in continuing the remarkably interesting researches of Prof. Klebs, which were referred to in this Journal, June 24, 1916, page 339, but also in following by microscopic means the normal course of development of these buds of fruit trees which in course of time become fruit buds.

Perhaps the most striking illustration of the determining influence of external conditions in the development of a plant is provided by the well authenticated behaviour of the buds of such trees as the Beech. As is well known, branches of Beech, if exposed to full sunlight, bear leaves of different anatomical structure from those on branches growing in shade. What, however, is more remarkable, is the fact that if a branch which grew, say, in shade in one year, is exposed in the following year to the sun, the leaves retain as it were the impress of the conditions imposed on them in their embyronic bud stage, and, despite the sunshine which greets them as they open out of the bud, develop the anatomical characters of shade-leaves. It is this interval between the operating cause and outward manifestation which adds so much to the difficulty of discovering the secrets of plant behaviour. For instance, there can be little doubt but that the reason for the greater productiveness of Scotch and Irish seed Potatos is to be sought and found in the soil conditions which attended the early development of that bud or collection of buds which is the Potato tuber. It would be well worth the attention of the investigator to inquire into the conditions of soil temperature and moisture which occur in the Lothians, and to compare them with those which obtain generally in districts less favourable to the production of prolific "seed."

* *Trans. of the N.Z. Institute*, XLIX, 1916.

The Surveyors' Institution.—The next ordinary general meeting of the Surveyors' Institution will be held in the Lecture Hall of the Institution, 12, Great George Street, Westminster, S.W., on Monday, April 28, when a paper, entitled "Notes on the Report of the Agricultural Policy Sub-Committee of the Reconstruction Committee," will be read by Mr. Joseph Henry Sabin (Vice-President). The chair will be taken at 5 o'clock.

Horticultural Instructor for Durham.—Mr. W. S. Sharp, gardener, Lilleshall House, Newport, Salop, has been appointed chief instructor in horticulture to the Durham County Council. Mr. Sharp has had a wide and varied experience in all branches of horticulture as well as forestry. He is an old Kewite, and since leaving Kew has had charge of various gardens, including Mr. A. Bulley's famous garden at Ness; Burton Manor Gardens, Cheshire; Ince Hall Gardens, Chester; and Swinfen Hall, Lichfield. For some time past Mr. Sharp has been assisting in lecturing and demonstrating for the Staffordshire Education Committee, and during the past season has acted in an advisory capacity to numerous small-holders, fruit growers and allotment holders in Staffordshire.

Rainfall in March.—According to *Symons's Meteorological Magazine*, the total rainfall of March exceeded twice the average for the month over practically all England and Wales, except in the eastern and extreme northern counties. The amounts varied from about 2 inches in East Anglia to more than 5 inches over large areas in the south and Midlands, and rose to above 10 inches in the Welsh mountains and the Lake district. In Scotland, the excess was not remarkable, and in many areas the fall was short of the average. Less than 2 inches fell on the east coast, and from 5 to 10 inches in the wettest parts of the Highlands. Ireland was wet generally, but a few scattered stations had less than the average. Less than 2 inches fell over the centre, and 5 inches was exceeded only in the extreme west. The general rainfall expressed as a percentage of the average was:—England and Wales, 196; Scotland, 105; Ireland, 112; British Isles, 143.

Successful Allotment Holders at Spennymoor.—The progress of the allotment movement is well exemplified in the case of the Spennymoor Allotment Holders, which was registered and affiliated to the Agricultural Organisation Society in September, 1917, and concluded that year with 55 members and a trade turnover of £17. At the end of 1918 it had 350 members and a trade turnover of over £600. This society has obtained from the local Urban District Council 16½ acres of land in different parts of the town.

Sir George Watt.—Sir George Watt, so well known for his botanical researches in India, and who resides at Annandale House, Lockerbie, Dumfriesshire, has been elected one of the members of the new Scottish Education Authority for Dumfriesshire. Sir George Watt, who is a member of several other public bodies, retains his interest in botanical work, and is a keen horticulturist, as the number of rare plants in his garden testifies.

Windsor Rose Show.—By permission of the King, Windsor Rose Show will be held on the slopes of Windsor Castle on Saturday, June 28. Among the cups for competition is the King's Challenge Cup for 48 blooms, distinct varieties.

Royal Botanic Society.—The President of the Board of Agriculture and Fisheries has appointed a committee to report what steps should be taken to render the work of the Royal Botanic Society of London as useful as possible from the scientific and educational point of view. The committee will be constituted as follows:—Lieutenant-Colonel Sir David Prain (Director of Royal Botanic Gardens, Kew), chairman; Sir W. H. Dunn, Bt. (Royal Botanic Society); Surgeon-General Sir A. Keogh (Imperial College of Science and Technology); Sir M. Morris, and Major R. C. Carr (Royal Botanic Society); Mr. Morton Evans (Joint Secretary of the Office of Woods); Mr. H. J. Greenwood (Royal Botanic Society); and Professor F. W. Keeble (Board of Agriculture and Fisheries and Royal Horticultural Society). Mr. G. C. Gough will be secretary of the committee.

A New Public Garden for Orleans.—Landscape architects in France are busy just now preparing to enter plans for the new public garden which is to be created at Orleans near the Boulevard Rocheplatte. The site, which has been acquired by the municipality, presents many favourable features, and there are likely to be a large number of entries for the competition. They will be judged after April 30, which is the closing date.

A Village as a War Memorial.—The family of the late Sir Thomas Storey have given the beautiful residence known as Westfield, Lancaster, with its extensive grounds, for the site of a war memorial village. The estate is within five minutes' walk of the town hall of Lancaster, and Mr. T. H. Mawson has laid it out as a model village, to provide accommodation for disabled service men. Mr. Storey has also agreed to provide on the estate a small ornamental park, bowling green, band-stand, tennis courts, &c., and the public are expected to provide cottages, hostels, workshops, &c., as memorials to those who have fallen and as thank-offerings. The village is designed to accommodate 200 men, and the proposal is to provide a hundred cottages (for married men with families), and three or four hostels for unmarried men. At present the mansion as it stands will be used as a hostel, but eventually, when the new buildings are erected, the house will be used as reading room, billiard room, club house and concert room. A Lord Roberts workshop is to be erected on the estate, and there will be other workshops, at which goods will be made by disabled men. In addition there are to be workshops and studios for craftsmen, designers, and artists. It is proposed that various architects shall be employed, so as to give "variety in unity" in the erection

NOTES FROM TASMANIA.

APPLE STOCKS.

The Tasmanian Government has appointed a Committee of three leading orchardists to invest and report on the merit of the blight-proof stock, as compared with the seedling Apple stock. It was suggested that the Committee should include a departmental officer and a nurseryman, but against that was the fact that the best officer for the work had already expressed his opinion, while to ask a nurseryman, who might have a large stock of either blight-proof or seedling stocks for disposal, to adjudicate, would be to place him in a position he should not be called upon to occupy. The Committee will have the assistance of the Government's micro-biologist and fruit experts will visit the principal orcharding districts. In a handbook still supplied to applicants blight-proof stocks are (on the authority of the late Government expert) warmly recommended, whereas the present fruit expert would not endorse that opinion. Probably the cessation of hostilities will bring a number of would-be orchardists here from over-seas. I most earnestly recommend them not to purchase properties before they know the facts; and I should be very happy to endeavour to assist them in the way of avoiding pitfalls. People who purchase horses scarce knowing the same from cows are generally accounted fools; but it is by no means very easy to convince those of a "know-all" type that the vendors of orchard properties are not invariably angels. *Arthur Garnett, Cambridge, Tasmania.*

PLANTS FOR DWELLING ROOMS.

Although the growing of plants in dwelling rooms is the oldest form of indoor cultivation, it was never practised to such an extent as it is now, and each season enormous numbers of pot plants are raised by nurserymen and sold in the markets for the special purpose of decorating dwelling rooms. The conditions in dwelling rooms are not very favourable to vegetation, and where gas is employed for lighting and fires used frequently the plants will not remain for long in a good condition. But many modern villa residences are fitted with electric light, and have spacious front windows; indeed, the recesses of some of these front rooms are almost like miniature conservatories, and they are suited to the growing of many plants in pots. But it is in the cottage windows in country villages that plants thrive best, and the cottagers' front windows are amongst the most interesting features in these villages. The cottager's wife tends her Fuchsias with the greatest skill, watering, ventilating and shading them from hot sunshine as carefully as would a trained gardener.

It is surprising how many uncommon plants may be met with in cottage windows; most of them probably came from "slippings" given by some gardener, or brought by some relative from overseas. It is stated that the Fuchsia was first discovered growing in a cottage window in London by Mr. Lee, a nurseryman of Hammersmith, and instances are known where species new to science have been discovered in a cottager's front room. A great variety of flowering plants will succeed in an ordinary room during the spring, summer and autumn, and with a few Ferns and other foliage plants the windows may be made bright and cheerful throughout the whole of the year. Many plants, after they have flowered early in the season and made their new growth, may be placed out-of-doors in a sheltered, partially-shaded situation for the wood to ripen before taking them indoors again for the winter. Such plants as are placed out of doors in this way should be kept rather dry at the roots, and given only sufficient water on mild days to keep them from flagging.

Plants grown just inside windows should be carefully examined for decaying foliage, and during cold, damp weather, if convenient, a fire should be lighted in the room. In very cold weather sheets of newspaper placed against the inside of the window will afford the plants considerable protection, and at night time in winter the blinds will also serve to keep out a considerable amount of cold. On fine days the window may be opened for an hour or so, but this must be done very cautiously, as cold draughts are very harmful to the plants, and would result in a check to growth. The best time for repotting indoor plants is in early spring; those that require increased root room should be afforded larger pots, but over-potting must be guarded against, and it is very essential to provide ample drainage. Certain plants will not need repotting for two years provided the soil remains sweet; a little concentrated fertiliser given at intervals would be beneficial to such plants. In watering the plants it is a great convenience to stand them in the open, and this allows damping them overhead to be done at the same time. When replacing them indoors pans are necessary under the pots to keep the water from dripping on the floor.

The following is a list of plants that are suitable for the purpose, and their cultivation is not difficult :—

Fig. 97.—Clivia (Imantophyllum) miniata: a good plant for dwelling rooms.

Flowering Plants for Dwelling Rooms.—Self-coloured, white-edged and grey-edged Auriculas. Perpetual flowering Begonias: B. Dregei, flowers white; B. fuchsiodes, bright coral-red; B. insignis, pinkish lilac; B. Knowsleyana, blush white; B. Sutherlandii, orange; B. Weltoniensis, light pink; tuberous Begonias of mixed colours. Cereus flagelliformis, the "Rat-tail" Cactus; C. speciossimus, intense crimson; Campanula isophylla, lilac blue; C. i. alba, white, both these Campanulas are fine plants for hanging baskets. Clivia miniata (see fig 97), a fine plant for its green foliage and large trusses of orange shaded flowers. Crassula (Kalosanthes) coccinea, which gives beautiful masses of scarlet flowers; Epiphyllum Gærtneri, brilliant scarlet. Fuchsias (double flowers) Avalanche, Ballet Girl, Brilliant, Duchess of Edinburgh, Phenomenal and Sylvia; (single flowers) Charming, General Grenfell, Mrs. Rundle, Mrs. Todman, Olympia and Rose of Castile. Zonal Pelargoniums, (single) Bowood, Dryden, Kingswood, London, Mrs. Brown Potter, and Snowdrop; (double) Decorator, Double Jacoby, King of Denmark; Hermione, Lord Derby and Madame Thibaut. Ivy-leaved Pelargoniums, Corden's Glory, Galilée, Incomparable, Jubilee, Madame Crousse and Souvenir de Charles Turner. Scented-leaved Pelargoniums, capitatum, Clorinda, denticulatum or Pheasant's foot, Lady Scarborough ("Parsley leaved"), quercifolium ("Oak-leaved"), and Rollisson's Unique. Mimulus moschatus, the common Musk, and Harrison's Musk. Myrtus communis, the common Myrtle, and the variety Jennie Reitenbach, with smaller foliage. Nerium Oleander album, double white, and N. O. roseum, double rose. Phyllocactus Akermannii, Agatha, Ena, Jenkinsonii, La Belle, and Niobe; and Vallota purpurea or "Scarborough Lily," bright scarlet.

Foliage Plants.—Aloysia citriodora, the sweet scented Verbena; Anthericum variegatum, green leaves striped with white, and pale blue flowers; Aralia Sieboldii, large green palmate leaves; A. S. variegata; Araucaria excelsa, pale green foliage; Asparagus plumosus; A. Sprengeri, bright green foliage, suitable for baskets; Aspidistra lurida, more generally used than any other plant for rooms; A. lurida variegata; Carex japonica variegata, with grasslike foliage; Cissus rhombifolia, trifoliate, dark green foliage, useful as a climber; Copresma Baueri variegata, of dense, compact habit; Eulalia japonica variegata, a tall, graceful grass; Farfugeum grande, leaves spotted with yellow; Ficus elastica, the "India-rubber Plant"; F. radicans, suitable as a hanging plant, small dark foliage; F. r. variegata, with creamy white variegation; Grevillea robusta, a plant with beautiful, fernlike foliage; Ophiopogon (Liriope) spicatus aureo variegatus, yellow variegated foliage; Ornithogalum longibracteatum, the "Onion plant," a favourite for cottage windows.

Palms.—Chamaerops excelsa, C. Fortunei, and C. humilis; Cocos Weddelliana; Corypha australis; Kentia Belmoreana, and K. Forsteriana; Phoenix canariensis, P. Roebelinii, P. rupicola; Rhapis flabelliformis.

Ferns. — Adiantum cuneatum; Asplenium Colensoi, A. dimorphum; Cyrtomium anomophyllum, C. falcatum; Lomaria gibba; Nephrolepis exaltata, N. exaltata superba, N. Marshallii, N. todeaoides, N. Whitmanii.; Onychium

FRUIT REGISTER.

APPLE SURE CROP.

At the Meeting of the Royal Horticultural Society on March 11, 1919, the Superintendent, of the Wisley Gardens, Mr. S. T. Wright, brought before the members of the Fruit and Vegetable Committee a late keeping culinary Apple, named Sure Crop (see Fig. 96). No one present seemed to know anything of the variety, which in many respects resembles Dumelow's Seedling, frequently known as Wellington. The flesh of Sure Crop is white and has a brisk, acid flavour, as in the case of Dumelow's Seedling. The variety is listed in Messrs. Clibran's catalogue, and we believe the trees at Wisley were sent there by that firm about fourteen years ago. Mr. Wright informs us that the tree is of sturdy growth and very free in cropping. The blossoms appear very late in the season and consequently the flowers are not very liable to injury by frost. The fruits are in season during March and are stated to be suitable for dessert as well as culinary purposes. They are deep green in the autumn, but change to yellow when kept for several months.

FIG. 96.—APPLE SURE CROP: A CULINARY VARIETY IN SEASON IN MARCH.

ANTIRRHINUMS AS SUMMER BEDDING PLANTS.

THERE are several reasons why Antirrhinums are so popular as summer bedding plants: they are easy to cultivate, and are not fastidious about their flowering quarters. In these gardens we fill two positions annually with many thousands of plants; one is a very hot and dry border, the other is a formal set of beds situated in a moist shady corner on the lawn, yet despite the wide gulf fixed between their respective conditions both batches of plants thrive exceedingly, and provide an exquisite and gorgeous display throughout the summer and autumn. Added to these qualities is the wide range of colours obtainable from the many varieties, and the trim, neat habit of the plants. Despite the comparative ease with which Antirrhinums may be grown, one often notices beds of plants that leave much to be desired, owing to wrong methods being employed. I am a firm believer in spring sowing to raise plants for summer bedding, treating the plants as half-hardy annuals. I am aware that many gardeners favour sowing in August for the same object, but my experience leads me to the conclusion that although plants raised from an autumn sowing are perhaps a trifle earlier in blooming, the late summer and autumn display is not nearly as good as that obtained from a spring sowing.

The seeds of Antirrhinums may be sown at any time from the beginning of February until the middle of March, but the ideal time is the second week in February, as the seedlings may then be kept growing on without check until the period arrives when bedding can be done. The seed boxes should be filled with a rich, open compost, and the seed sown thinly, an important detail to observe, as not only are stronger plants obtained, but if, owing to pressure of other work, the transplanting of the seedlings is delayed, the seedlings will not suffer nearly as much from neglect as they would if the seed had been sown thickly. After sowing place the boxes in gentle warmth, and when the seedlings are a suitable size harden them gradually on shelves close to the roof-glass in a cool house. Some growers advise pricking out the seedlings twice, first in boxes and a second time in cold frames; but I have always found one transplanting sufficient to secure ideal plants. Transferring the seedlings direct from the seed boxes into cold frames may be done with safety; indeed, I consider coddling is often responsible for the many indifferent results obtained. Prick out the seedlings into cold frames when large enough to handle, using a fairly rich, open compost. Allow the seedlings plenty of room, say, six or seven inches apart, because, even if growth is slow at the start, they develop rapidly during April. Keep the frames quite close until the plants are rooted, and afterwards admit air freely until the lights may be removed altogether.

I have seen it stated that the tops should be pinched out of the plants when they are three inches high, on the ground that bushier plants are obtained. Stopping, however, I would on no account recommend, as I believe that by doing this the best flower-spikes would be lost. The naturally shrubby habit of the Antirrhinum always ensures bushy plants, and for that reason I would strongly urge that the plants should be allowed to grow naturally. Bedding-out may be done at the beginning of May, and if good plants are used there will be a moderate amount of bloom in early June. Before lifting the plants from the frames the roots should receive a thorough soaking of water to ensure lifting each specimen with a good ball of soil attached. Set the tall varieties eighteen inches apart each way; for intermediate and Tom Thumb varieties a space of fifteen inches is sufficient. During the summer it is highly important to keep the seed-pods removed.

Varieties are very numerous. Amongst the tall sorts Cloth of Gold, Pure White, Orange King, and Crimson and Gold are all fine. Intermediate varieties are perhaps best represented by Fire King, Delicate Pink, Orange King, Rich Apricot and Bonfire, whilst amongst dwarf sorts I recommend White Queen, Yellow Prince and Crimson King. Dobbie's Brilliant, Moonlight, White Beauty, and Yellow Queen are other desirable varieties. *F. W. Miles, Ware Park Gardens, Ware.*

NOTES ON IRISES.

THE SNAKE'S HEAD IRIS.

"THIS species of Iris, readily distinguished from every other by its quadrangular leaves, is more remarkable for the singularity than for the beauty of its flowers; yet to some minds not apt to be caught by gaudy attire these sombre tints have their charms." Thus wrote Wm. Curtis in the *Bot. Mag.* in connection with an illustration of Iris tuberosa dated Sept. 1, 1801. The popular names given to the plant on that occasion were Snake's Head Iris and Velvet Flower-de-Luce. The first of these two popular names is now in fairly common use, but another title is common in Covent Garden flower market whither small quantities of flowers arrived this Spring from the Scilly Isles. This title—the Widow Iris—is in keeping with the colouring of the bloom, which is bright green, with a dull yellow median band on the inner surface of the outer segments, this band ending at the "falls," which are dark lurid purple, or for all practical purposes, black. The flowers sold readily, so even with florists "these sombre tints have their charms."

So far as cultivation is concerned, Curtis's remarks over a century ago, borrowed from Philip Miller, may not be altogether at variance with modern ideas. He considered the plant perfectly hardy, flowering best in an eastern aspect, "and if the soil be light it will be proper to put some rubbish at the bottom to prevent the roots descending too deep, in which case they seldom produce flowers." Miller's advice not to keep the roots long out of the ground, when propagation is being effected by offsets, is obviously good.

According to modern authorities this quaint and interesting plant is not Iris tuberosa, but Hermodactylus tuberosus. It must not be forgotten, however, that Curtis gave Hermodactylus folio quandrangulo as a synonym of I. tuberosa. In this commercial age the chief interest of this brief note lies in the fact that flowers of the Snake's Head or Widow Iris are saleable in Covent Garden. *C. H. C.*

I have no fear that these workers will seriously interfere with the usual employment of men in the garden. Many were utter failures, and their retirement will be accepted without regret. I have no prejudice against women gardeners, but between the real woman gardener and the majority of women doing garden work there is a great and significant difference. If a woman of sound constitution chooses in her early youth to follow the occupation of gardening seriously, and gain her livelihood thereby, I do not for one moment doubt but that she can, by perseverance, gain advancement and experience and be entitled to a position of equality with the majority of men of her age. The ordinary woman gardener will only be successful in obtaining employment in the garden when men cannot be obtained, unless she be one of the most energetic workers and equal in constitution to her task. A skilled woman gardener will stand a fair chance in many places, and should do if she obtains her experience on the same footing as a man, but the usual method is rarely followed by them. Horticultural Colleges and Institutions usually provide their training, and the experience gained therein is not always the most suitable for the average large garden. That women trained for a year or two in a college can do as much as a gardener with a life experience is too absurd to discuss. Until women gardeners can do all things themselves independently, as they would wish and expect those under them to do, they are in no wise entitled to a position of authority or responsibility. Women can only attain success as gardeners by the same method of training as men. *Bertram J. Hedger, Tredegar Park Gardens, Newport, Mon.*

Potatos Diseased in April.—It has been the custom here for years to grow Potatos on hot-beds for use about the middle of April. This year I had plants in three frames, all in splendid health until about a fortnight ago, when they were suddenly attacked very badly with Potato blight, and are now practically ruined. I sprayed the haulm with Burgundy mixture, but it was too late to save the crop. The variety is Myatt's Ashleaf; the seed was home-saved, and the crop was practically free from disease last year. It would be interesting to know if any of your readers have had this happen to a crop so early in the season as the first week in April. *E. Sutton, Kilkenny Castle Gardens.*

Phytophthora disease of Tomatos (see pp. 142, 157, 183, 188).—Five years this spring I had very fine seedlings of the then new variety, "Aviator," that grew into strong, healthy plants, until they were shifted into 48 sized pots. Within a week from the date they were re-potted I found, to my amazement, that every plant had collapsed similar to the one illustrated in fig. 86. As they were the earliest plants I had, I was at a loss what to do, so decided to insert the healthy tops as cuttings. The shoots were removed at the first leaf and inserted separately in 70 sized pots. The cuttings were kept close for a few days, then air was admitted gradually, and from that time they grew into fine healthy plants and produced a grand crop of fruit without the slightest sign of disease. In this way I was successful in obtaining a batch of about fifty plants. *D. Burridge, Nether Close Gardens, Leicester.*

Big Bud Mite (see pp. 141, 156, 183).—Black Currants are badly affected with big bud mite in Northumberland, and, conscious of the relative futility of the cures or preventives recommended from time to time, I have been interested in varieties for which immunity is claimed in respect to the pest. Up to now, however, I have experienced only negative results. Three years ago, for instance, in a garden containing Currants badly affected with big bud I planted the following varieties of Black Currants: Victoria, Edina, Boskoop Giant and Seabrook's Black. At the end of two years my hopes in respect to the two last-named varieties were somewhat flattered, seeing that they were still quite free from the pest, whereas Victoria and Edina had both become infested. This, the third year, has demonstrated, however, that the immunity referred to is only relative since both Boskoop Giant and Seabrook's Black have both fallen victims to a moderate extent. Perhaps the results are not altogether disappointing since it is certainly something to have varieties exhibiting comparative immunity. In relation to the pest, it is interesting to note that it proves most troublesome on the drier soils, though this, of course, may merely bear relation to the moderate growth occurring under such circumstances. *Chas. W. Mayhew, Morpeth.*

Gardeners' Hours and Wages (see p. 196).—The writers on this subject do not advise how any rule of wages or hours can be enforced, and as matters are now no one can. The general secretary of the B.G.A. advertises that a new standard of wages and hours has been adopted, when he must know that he cannot enforce it. Till such time as this can be done it is not right to ask gardeners to subscribe to the funds of his association. Recently 345 gardeners applied for one place (see page iii, April 5th), and for a gardener for a place known to the writer, advertised in *The Gardeners' Chronicle* recently, there were 221 applicants, many asking 30s. a week. What is the employer to think? Is he to ignore all those who asked 30s. and give 50s.? Again, a gardener engages a foreman at 40s. a week, when he himself only gets 38s. When he mentioned it to his employer the answer he got was that he saw plenty of gardeners advertising for places, and very few wanting gardeners. Now if this gardener had downed tools would there have been a general strike till he was reinstated at a standard wage? No; hundreds would have been after the place, glad to take less than the 38s. It has been a very hard time for gardeners during the past four years, and many have worked long hours to keep things going. Gardeners ought to have better pay, but how are they to get it? If they all come out for better pay will the B.G.A. house and keep them till the wages rise all round? The writer knows a gardener who had ten to twelve hands in pre-war days under him, and he does not get the wages of the cowman and carters, viz., 36s. a week. Then there is the question of the boys of eighteen getting 31s. At this rate a good foreman of twenty-six to thirty should have 60s., and the head be paid in proportion. Gardeners can never demand high wages unless, by some means, they become united. However, there may be a better future for them if the wages question keeps so many from entering the profession. *W. M. G.*

——Most gardeners, especially those holding responsible positions, will, I should say, be in total agreement with Mr. Elwes in his article on the above subject, on page 144. The writer points out many of the inconsistencies of trade unionism as applied to gardeners, and he might well have indicated many more. In the majority of gardens the remuneration does not solely consist of the money paid, as the advocates of Socialism would have us believe. Again, the weak point of trade unionism, and an exceedingly weak one, is that all workmen are to be considered equal, yet anyone who has had a number of men under his charge is fully aware that some are worth at least half as much again as others. This Socialism, if it takes hold of the gardening fraternity, will destroy all friendship between employer and employee, and prove to be a great set-back to horticulture, for as Mr. Elwes observes, no union can force employers to employ its members at all. Should gardeners as a class go in for trade unionism, the only ones likely to benefit are a few loud-voiced men who, dissatisfied with gardening and everything else, will become secretaries of some branch or other. In all this spirit of discontent the lover of plants will find no scope for his energies. As the pace at which an army marches depends upon its slowest unit, so this spirit of Socialism will bring all to the lower level. Before young gardeners join trade unions under the idea that they are benefiting themselves, they had better beware that they do not find themselves under a far worse tyranny than before.—*An Old Gardener.*

SOCIETIES.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

April 14.—The Monthly Meeting of this Society was held in the R.H.S. Hall on Monday, the 14th inst., Mr. C. H. Curtis in the chair. Eight new members were elected. Four members withdrew interest amounting to £15 13s. 10d., and one member over the age of 70 years withdrew £2 4s. 10d. from his deposit account. The death certificates of two members were received, and the sum of £58 17s. 2d. was paid to their respective nominees, also the death certificate of one lapsed member, and the sum of £3 2s. 8d. was paid to his nominee. One member was granted 5s. per week for life from the Distress Fund. The sick pay on the ordinary side for the month was £90 13s 4d.; State section £38 16s. 8d; and maternity claims £6.

TRADE NOTES.

The Canadian Mission, which has recently been established in London at 1, Regent Street, S.W.1, by the Dominion Government, was constituted by an Order of the Canadian Privy Council in November, 1918, and Mr. Lloyd Harris was appointed chairman of the Mission.

The objects of the Mission are as follows:—

(a) The serious tonnage position arising out of the war, coupled with the numerous restrictions put in force, both in the United Kingdom and in Canada, on import and export trade, tended to sever old connections which had existed for generations between the Mother Country and the Dominion. It is one of the duties of the Mission to study the question at first-hand and to devise the means of re-establishing the traditional trade.

(b) A great work of reconstruction and reorganisation must be undertaken in Europe during the next few years in order to repair the devastating effects of the war. Raw materials, etc. will be necessary for this work, and many articles required can be obtained from Canada. The Mission hopes by means of negotiations with the Governments of the countries concerned to make arrangements for the supply of such goods to the advantage of all interests involved. It is further considering how, by a system of credits, to assist the Governments in purchasing the materials.

(c) The Mission is convinced that the resettlement of Europe is largely dependent on sufficient supplies of food being available and distribution being properly organised. The food can only be obtained in two ways:—

(1) By imports from countries having margins for export; and

(2) By increased production in Europe itself.

Canada has large supplies which she is willing to place at the disposal of Europe, and, moreover, by reason of the fact that she has always specialised in the manufacture of agricultural machinery and implements, she is in a position to come to the assistance of the nations of Europe in their endeavours to produce supplies wtihin their own borders.

The officials of the Mission will at all times be willing to advise persons in the United Kingdom desirous of obtaining information with regard to Canadian trade.

The Chamber of Horticulture is organising a conference to be held on May 21 at the Royal Horticultural Society's Chelsea Show, when a debate on "Increasing the Supply of Home Grown Fruit" will be contributed to by Mr. W. G. Lobjoit, J.P., Mr. Smith, of Loddington, Professor Salmon, of Rye, Mr. F. Hammond, of Pilgrim's Hatch, and others.

On July 3 and 4 the Chamber is organising an Exhibit of Produce (at the request of Mr. Geoffrey W. Henslow) on behalf of St. Dunstan's Blinded Soldiers and Sailors After Care Fund. Societies or firms willing to co-operate are invited to communicate with the Secretary of the Chamber, 11, Adam Street, Adelphi, W.C.2.

japonicum; Osmunda palustris; Polypodium aureum, P. Mayii, P. sporadocarpum; Pteris Childsii, P. cretica major, P. serrulata, P. Summersii, P. tremula, P. Wimsettii; Scolopendrium crispum, S. c. cristata major; Selaginella amoena, S. Emiliana; Todea arborea.

Miniature Succulent and Other Plants.—Aloe aristata, A. brevifolia, A. variegata; Crassula (Rochea) falcata; Echeveria agavoides, E. atropurpurea, E. metallica, E Peacockii, E. retusa floribunda, E. secunda glauca; Gasteria disticha, G. verrucosa; Haworthia margaritifera; Mesembryanthemum blandum, M. candens, M. crystallinum (Ice Plant), M. curvifolium, M. muricatum, M. roseum, M. spectabile; Pilocereus senilis (Old Man Cactus); Saxifraga Fortunii, S. longifola, S. nepalensis, S. pyramidalis, S. sarmentosa (Mother of Thousands), a good basket plant, a cottage window favourite; S. s. var. tricolor, with red and white variegated leaves. *John Heal.*

NOTICES OF BOOKS.

TEXT-BOOK OF BOTANY.

At the present time, when there is a call for scientifically trained horticulturists, it is a pleasure to be able to recommend an introductory book on botany which is suitable for placing in the hands of young gardeners. There are many botanical books for beginners, but only two or three which really fulfil their purpose. Too many elementary books read like paradigms of irregular verbs to be of any use other than for examination "cram" purposes.

The book* now under review, although written for the Cambridge Senior Local Examinations, is one which can be read without the feeling of a possible future nemesis. It is written by a physiologist, and has a physiological bias, which is all to the good from a horticultural point of view. There are instructions for numerous simple, though often fundamental, physiological experiments. Following an introductory chapter, the functions of plant organs and the food of plants are dealt with; the remaining sections have as their headings Form and Structure; Reproduction; Classification; and Plants in Relation to their Environment; and a supplementary section deals with seedless plants.

The section on classification is much better than is usual in modern elementary text-books, and is treated on evolutionary lines, though only a small number of families (16) are described. We believe that if horticultural students would endeavour to learn the characters of flowering plant families (or Natural Orders, as they were previously called) on evolutionary principles, they would find classification one of the most interesting parts of their botanical studies, rather than the dryest subject, only to be tackled under compulsion.

The supplementary section on seedless plants has been added for examination purposes. The treatment is necessarily inadequate, though what there is appears to be sound.

The illustrations, many of which are old friends, are excellent, and the general style of the book is of the quality to be expected from the Cambridge Press.

* *Botany: A Text Book for Senior Students.* By D. Thoday, M.A. (Cantab.). Pp. 642; figs. 250. Cambridge: At the University Press, 1919. Reprinted with Supplement.

Fig. 98.—Hanging basket of begonias.
(*See p.* 207.)

THE SCIENCE AND PRACTICE OF MANURING.

A revised and enlarged edition of Mr. Dyke's well-known and instructive book* gives full instructions on questions relating to manuring, and deals with the origin and history of manures, plants and their food, the influences of manures on crops and on soil sterilisation. General manures and concentrated fertilisers receive attention and directions for their use for particular crops are given in detail. The book ends with a chapter on "Points to Remember when Manuring," in which some excellent advice is offered, but we see no mention made of one of the greatest abuses to which artificial manures are liable to be put, viz., the tendency to a one-sided or incomplete manuring. A note of warning on the haphazard purchase of "special" manures might well be incorporated in this chapter.

There are one or two small errors in this book which have escaped the eye of the proofreader, but the one appearing in bold type as a heading to Chapter V., "Soil Fertility and Partical Sterilisation," and which is again repeated in a sub-heading, is hardly excusable.

* *The Science and Practice of Manuring.* By W. Dykes, with introduction by J. Wright, V.M.H. London: The Lockwood Press. Price 2s. net.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Quercus coccifera.—In the note on this Oak (p. 195) I omitted to mention that there is a full and interesting account of its relationship with the "Kermes" dye or "Scarlet grain" in the *Kew Bulletin* for 1910, p. 167. This was, indeed, the source of the information there given. *W. J. Bean.*

Shamrock.—In the issue for March 29, p. 160, your correspondent *K., Dublin*, states that evidence is "not wanting to show the original plant thus honoured [as the 'Shamrock of Ireland'] was Oxalis Acetosella." As I am particularly interested in the identity of the "original" Shamrock, I shall be glad of a reference to the evidence referred to, as I believe it is recognised by those who have gone into the question that out of the half-dozen or so possible species Wood-sorrel is the least likely to have been the plant in question, if, indeed, it stands any chance at all, which seems to me very improbable. *C. Nicholson, 35, The Avenue, Hale End, E.4.*

Birds and Fruit Buds (see pp. 237, Vol LXIV., 114, 128, 173).—I was very interested in the experience of your correspondents *re* the sparrow. I do not think Mr. Stanbury's patience has been strained to the extreme, as mine has, for besides losing fruit buds, our seedling Sweet Peas, Culinary Peas, Lettuce and Spinach have been destroyed by this bird. I agree sparrows destroy many insect pests, but in my thirty-five years' experience I have proved that the sparrow can be spared from gardens. I was for some few years in a garden where the sparrow never troubled us in any way; very few of the birds were ever seen in the garden, which was much more prolific than my present one, and notwithstanding the absence of the sparrow there was no increase of insect pests whatever. We have in this country many summer birds of passage and I believe that they are chiefly insect feeders. I quite believe these summer visiting birds would be, like myself, all the happier in our garden without the troublesome sparrow. I should like to be able to put the eggs of these birds into the sparrow nest and do away with the sparrows' own eggs, for there is no doubt that birds keep to the same locality where they are hatched. I believe we should be justified in reducing the number of these trying birds, as Mr. Turner suggests. *W. Chaffer, Broadlands, Effra Road, Brixton, S.W.*

——I read with interest the note by *Market Grower* on the visitation of bullfinches in fruit plantations. I congratulate him on his freedom from these birds. We have been treated quite the opposite to *Market Grower*, having had most of our Plums practically stripped of both fruit and wood buds. The varieties mostly attacked were Victoria, Prince of Wales, Monarch, Grand Duke and Pond's Seedling; no Plum trees have entirely escaped damage. Bullfinches have been generally a nuisance in this part of Suffolk (S.E.). We noticed last week they had started on the fruit buds of Pear trees. Apples up till the present time they have not touched. *R. B.*

Women in Horticulture (see pp. 77, 114, 128, 156, 169, 196).—I have followed closely the progress of women gardeners, and I have little hope for much success on their part, in most branches of horticulture. I read with interest the views expressed on this subject by your correspondents in previous numbers of this journal, and with them I fully agree that women cannot altogether take the place of men in the general routine of large gardens. The advent of women in horticulture cannot altogether be attributed to the war, because they were slowly establishing themselves for years previously, but were rarely found as probationers among the staffs of the principal gardens. The number of women workers in the garden increased considerably, and female labour was a necessity in many places when the ranks of the men were depleted for war services. Although many did well for the time,

DON'T WAIT FOR YOUR COPY

It's a mistaken idea to think you have to wait till the warm weather to get YOUR Free Copy of our 164-page GUIDE TO GARDEN WISDOM & GUARANTEED SEEDS. The Guide can be sent to you just as easily and quickly now as a month later. Don't delay another day in finding out about Guaranteed Garden Seeds and HOW THEY DOUBLE YOUR GARDEN OUTPUT of delicious fresh Vegetables and lovely flowers. Better than doubling your garden ground, and much easier and cheaper. EVERY packet of Seeds ordered thence MUST grow for you and please you or you will get it replaced freely. Send a postcard for the Free Guide to-day. Tells you the whole story—no obligation. Address us personally:

CROPS AND STOCK ON THE HOME FARM.

Wireworm.

One of the worst pests the farmer has to contend with is wireworm. The grubs eat the stem of Oats and Barley immediately above the seed, and almost directly the seedlings appear above the surface. As a preventive in any soil other than newly ploughed up grass, Sainfoin or leys, clean cultivation and frequent moving of the soil, with liberal manuring, are useful for enabling the plant to grow quickly out of the stage when it is most liable to attack. A fillip to growth is required when wireworm is suspected in the soil to hasten the formation of the second and third leaf, as after that stage of growth wireworms do no harm. One cwt. of sulphate of ammonia per acre, sown evenly over the field likely to be attacked, directly the plant shows through the soil, is a good preventive.

Grass for Hay.

No time should be lost in "laying up" pastures from which hay is to be cut this season. If basic slag was sown over the surface in the autumn a dressing of 2 cwt. of sulphate of ammonia per acre should be applied now. An alternative to the basic slag now would be 4 cwt. superphosphate per acre, or a similar quantity of dissolved bone compound should be sown before harrowing the surface, which is beneficial in scattering cattle droppings, removing moss and preparing an even surface by filling holes, which will facilitate the cutting of the grass. Afterwards roll the surface firmly.

Mechanical Power.

The difficulty of purchasing horses except at a very high figure is compelling farmers to depend more and more upon mechanical power. Army horses sell readily at 130 guineas, and at this figure they are too expensive for the ordinary farmer, although the best animals give the best return in good work.

The motor tractor has come to stay, as it can be used on the farm for many purposes. I am using now a Titan tractor, 10—20 h.p. This cost £385, with a few accessories as an additional charge. The firm supplying the tractor gave a week's free tuition to two of our employees—an expert ploughman and a youth of 19. The ploughman has an advantage over an ordinary mechanic in that he understands how the ploughing should be done in various fields and for certain crops. In our case the men were easily taught, and it is an advantage to teach two to drive the tractor, as in the case of illness the ploughman can take charge and almost any ordinary labourer can, after half an hour's teaching, manage the plough, and thus the work is not delayed during a busy season.

The Titan tractor is easily managed and appears to meet many requirements. It starts on petrol (which, during the warmer weather, does not exceed half a pint daily), and after starting it runs on paraffin and uses 3½ gallons per acre for ploughing, and 12 gallons for an ordinary day's threshing from 7 a.m. to 5 p.m. In ordinary light soil as much as five, and even six acres per day of 10½ hours can be ploughed; and this area would require at least twelve horses. At one time an acre per day was the standard amount of work for two horses and a man, but I cannot say this standard is reached at the present time.

Tractor ploughing is a distinct gain to the farmer in the saving of time, and certainly the work can be done better, especially when the man in charge is an expert ploughman. Both men were supplied with a typed copy of instructions. I need hardly say the principal business is the regular and careful oiling of all the parts of the tractor; wasteful lubrication adds to the cost without any extra return. In the case of ploughing it is a wise arrangement to pay the men a small sum, say, 3d. per acre each, as an encouragement, provided, of course, there is no scamping of the work.

I use a Cockshut plough, with four furrows, during three parts of the year, and one less for the winter months so as to reduce the strain on the tractor during adverse weather. This plough is easily handled by a youth and the mechanism is simple. I need hardly say that the fields should be ploughed the longer way, thus avoiding as much as possible the necessity of frequently turning. A useful implement to attach to a tractor is a wide cultivator, or scarrifier, one that will move the ground in breadths of 10 feet or more. When preparing land for Barley or roots, such an implement is a boon, especially in light soil.

For threshing corn my practice hitherto has been that of hiring threshing tackle at per sack, but of late, owing to the lack of machines, I, with others, have suffered much inconvenience, so it was decided to purchase a Marshall Drum, which it is expected will pay for itself in three years. Roughly, it cost us £100 per year for threshing the Corn new, but with the tractor and the Drum the threshing is as well done as by any other method. Another advantage in using the tractor is that one can thresh when it is convenient to do so. The tractor drives the threshing machine even easier than it ploughs. The ordinary horse elevator is easily fitted with driving gear to the threshing drum, which answers admirably, thus saving the cost of a new straw carrier. A ploughman feeds the thresher, which is the most important point to study in the threshing of any kind of corn. The drum is fitted with all the latest improvements for threshing and screening corn. The tractor easily moves the drum about where the roads are reasonably good, although its total weight is 5 tons.

Implements.

One of the most seasonable and useful implements is the artificial manure distributor. At this time of the year especially, fertilisers are largely used for the various crops. Special fertilisers are employed for stimulating weakly-looking Wheat, to give better straw and corn, and a similar dressing is at times required by Barley. Then there are the various manures used for Mangolds, Potatos, Turnips and other root crops, all of which should be sown broadcast, as the seed is sown or before. There are also various stimulants to be applied to grass. For all this work I use a No. 2 "Jack's Imperial" distributor with a sowing breadth of 9 feet. This machine, drawn by one quick moving horse, will cover efficiently 9 to 10 acres per day. The machine being built low, the manure is distributed evenly within a few inches of the ground, thus enabling the work to be done during windy weather. By a simple adjustment any quantity from 1 cwt. to 10 cwt. per acre may be sown. Two special points to consider in the efficient working of the machine is to keep the wheel bearings thoroughly oiled and the distributing parts free from manure corrosions: superphosphate especially is liable to clog the parts, as with continual churning parts of it become soft, clogging the wheels, which should always be cleaned before storing for the night. One of these machines will do the work much superior to that of four men with the old-fashioned seedlip. *E. Molyneux.*

The Meadow Hay Crop.

The removal of all restrictions on this year's hay crop is announced by the War Office and the opportunity of growing and selling freely should encourage farmers to make special efforts to secure a good yield. The feeding value of good meadow hay is high, nearly as high, for instance, as that of undecorticated cotton cake, and hay is equally in demand in both town and country. The weather, which is restricting most farming operations at present, will not prevent attention being given to meadows, and much can be done to improve both the quantity and quality of this year's crop. Steps might, for instance, be taken, by suitable manuring, to increase the yield from the large areas of land which have been impoverished by a long course of annual mowings, followed by grazing by store stock. With such land an immediate application of 1 cwt. sulphate of ammonia and 2½ cwt. superphosphate per acre should produce a marked advance on the usual returns.

ANSWERS TO CORRESPONDENTS.

Cymbidium Lowianium: *W. L.* The contents of the seed capsule which you describe as "fine, powder-like stuff," include the seeds, a fair proportion of which seem to be perfectly good and would probably germinate in sufficient numbers in a warm house. The better way would be to sow some of the seeds on the surface of the material in which the parent plant or some other Orchid is growing, and which is not likely to be disturbed for a year or so. The remainder may be sown in a seed pan, which should be placed in a glass-covered frame in a warm house, with the pot standing in a shallow pan of water. Orchid seeds generally require a long time to germinate, and you must not condemn the seeds too soon if there is apparently no sign of germination.

Early-Flowering Chrysanthemums: *M. B.* Good early-flowering Chrysanthemums for the supply of cut-flowers are Almirante, the varieties of Mdme. Marie Massé, Perle Chatillonaise, Normandie, Dolores, Elstob Yellow, Caledonia, Roi des Blancs, El Draco, Sanctity, Goacher's Crimson, and Market White.

Maggoty Pears: *Miss C. J.* We suspect the injury is caused by the maggot of the Codlin Moth. The female insect first appears about the time the blossom commences to fall, and lays its eggs, sometimes on the sides of the embryo fruit, and sometimes on the leaves. As soon as the caterpillar is hatched it crawls over the Apple or Pear until it reaches the eye, and then commences eating a passage deep into the fruit. The best plan of destroying the pest at this season is to spray the trees with an arsenical poison directly the blossom has fallen. The arsenate of lead spray recommended on page 193, used at the rate of half a pound of arsenate of lead paste to ten gallons of water, will destroy the pest. Next June place a band of hay or old sacking around the trunk of the tree, close to the ground. If the bands are removed in winter they will be found to contain many of the cocoons of the Codlin moth, which may be destroyed by burning.

Market Buying: *A. S.* As you are within a reasonable distance of London you should attend Covent Garden market at least one morning each week. By this means you will be enabled, as in no other way, to keep fully in touch with the markets and the ruling prices, and you will be as well repaid for your time and trouble as you would be if the time was spent in jobbing gardening. There are many good salesmen who would endeavour to meet your requirements, but you should study the market for yourself rather than trust to the judgment of others. In ordinary times salesmen occasionally have a surplus of certain things and are often willing to sell cheaply to the retailer. An inexperienced buyer might be tempted with the offer only to find himself saddled with goods, though obtained cheaply, which would show nothing but loss on the transaction. In commencing a business of the nature you propose we advise you to buy sparingly of all perishable produce. Roots and fruit, which will keep longer, may be purchased in larger quantities. Study quality in what you purchase and arrange with the salesman to send you by rail goods you may require between your weekly visits. Look carefully round the market and make your own selection for this purpose.

Names of Fruit: *I. J.* Wyken Pippin.

WANTED, FOREMAN for Fruit and Plant Houses, good wages, with bothy, etc.—Apply with particulars to HEAD GARDENER, Revesby Abbey, Boston, Lincs.

PLEASURE GROUND FOREMAN wanted with good general knowledge of private grounds, where several men are kept; state experience and wages required; lodge provided.—Apply, W. H. SEXTON, Bailiff, Heatherden Hall, Iver Heath, Bucks.

WANTED, FOREMAN and JOURNEYMAN Inside; also JOURNEYMAN for Flower Garden; good wages, bothy, &c.—State full particulars, G. BARRELL, Chalfont Park Gardens, Bucks.

WANTED, two good JOURNEYMEN for Outside; wages 30s. and bothy; age about 22, with experience.—Apply to W. WARD, Ken Wood Gardens, Hampstead, London, N.W.3.

JOURNEYMAN for Inside, age about 23; wages 33s. weekly, bothy, vegetables, attendance, etc.—Apply, F. B. BURBIDGE, Goldings, Hertford.

WANTED immediately, six JOURNEYMEN or IMPROVERS for Flower and Vegetable Gardens, and one JOURNEYMAN for Greenhouses; able to take charge; no bothy.—State age and wages required, "I. D.," Box 10, 41, Wellington Street, Covent Garden, London, W.C.2.

WANTED, two JOURNEYMEN, one Inside, one Outside; bothy, etc.; hours, 7 to 5; wages, 30s. per week.—Apply T. CRADDOCK, Middleton Park Gardens, Bicester, Oxon.

WANTED, JOURNEYMAN for the Houses; wages 30s. per week; bothy, etc., and attendance.—Apply, A. BULLOCK, Copped Hall Gardens, Epping.

WANTED, JOURNEYMAN, chiefly Outside; Lawns, Herbaceous Borders, etc.; duty; 30s. per week, bothy, milk, vegetables.—Apply, with full particulars, to T. HERBERT, Tilstone, Tarporley, Cheshire.

WANTED, two experienced JOURNEYMEN, one for Inside and one for general Outside work, able to take duty inside; no bothy.—Apply, stating age, experience and wages, to A. REEVES, Sunyfield Cottage, West Heath Road, Hampstead, N.W.3.

WANTED, JOURNEYMAN for Pleasure Grounds and general Outside work; wages 30s. week, with bothy.—Apply, stating experience, to E. SIMS, Holly Lodge, Highgate, N.6.

WANTED, JOURNEYMAN to look after Fruit and Plant Houses; wages 30s., bothy and attendance.—SIMS, Grove Gardens, Stanmore, Middlesex.

WANTED, JOURNEYMAN for Fruit Houses.—State experiences and wages required, with bothy, etc., to W. H. BACON, Mote Park Gardens, Maidstone, Kent.

WANTED, JOURNEYMAN for Kitchen Garden; 30s. weekly; bothy, etc., and attendance; 1 o'clock Saturdays; take turn with duty, 6s. extra.—References and particulars to R. G. PRINGLE, Hall Place Gardens, Tonbridge, Kent.

WANTED, JOURNEYMAN for Inside, about 26 years.—Apply, stating wages required with bothy and Vegetables, to J. PEPLOW, Compton Verney Gardens, Warwick.

WANTED, JOURNEYMAN for Fruit and Plant houses; wages 35s., no bothy.—State age and experience, W. HIGGS, The Lodge Gardens, Holyport, Nr. Maidenhead.

WANTED, JOURNEYMAN to assist Fruit FOREMAN with Vineries and Peach houses, &c.; assist Outside when required.—State age, experience, and wages required with bothy, coal, light, vegetables, and attendance, J. G. BESANT, Hall Gardens, Melton Constable Park, Norfolk.

WANTED, two JOURNEYMEN for Fruit Houses.—State experience, wages required with bothy, and vegetables, D. BATH, Rousdon Gardens, Lyme Regis.

WANTED, JOURNEYMEN for Pleasure Grounds; help with duty; 35s. per week, bothy, &c.; also GARDEN LAD.—State particulars, age, and wages required with bothy, A. FALCONER, Poulton Priory Gardens, Fairford, Glos.

WANTED, two good JOURNEYMEN for Outside; 30s. per week, bothy, milk, and vegetables.—Apply, HEAD GARDENER, Houghton Hall, King's Lynn.

WANTED, two good JOURNEYMEN, one for Fruit, one Plants; wages 35s. per week, bothy; extra for stoking; half-day a week; good references required.—F. JOHNSON, The Gardens, Maiden Erlegh, Reading, Berks.

WANTED, JOURNEYMAN GARDENER, with some knowledge of hardy plants.—Apply, E. MARKHAM, Gravetye, East Grinstead.

WANTED, in large Garden, a good, experienced MAN as Second Outside, not under 26; take charge of Herbaceous borders, Peach wall, and other Fruits; wages 32s. weekly; bothy and usual allowances, 9d. per hour overtime, 1 o'clock Sat.—H. LLOYD, Tewin Water Gardens, Welwyn, Herts.

WANTED, experienced MAN for Inside and Out; duty alternate weeks; good references; 40s. weekly.—E. C. WICKENS, Tewkesbury Lodge Gardens, Forest Hill, S.E.

WANTED, two good MEN, one for Pleasure Grounds and Fruit Trees, one as Cowman and Kitchen Gardener; £2, no bothy; single preferred owing to house scarcity.—GARDENER, Feltham Lodge, Feltham.

WANTED, strong single man as GARDENER'S ASSISTANT; some experience in Kitchen and Pleasure Grounds; take duty; lodgings provided. State wages and experience.—Mr. PORTER, Gardener, Longworth Manor, Berks.

WANTED, YOUNG MAN for Inside and Out; duty paid; 1 o'clock Saturdays.—Apply, stating wages required, with bothy and vegetables, to W. MILES, Caversham Park Gardens, Reading.

WANTED, strong YOUNG MAN for General Garden work; some experience necessary; 25s. with good bothy, etc.; duty.—Head Gardener, Ellisfield, Manor Gardens, Basingstoke, Hants.

WANTED, YOUNG MAN for Inside and out. Please apply stating age, experience, and wages required. — J. H. TRUMAN, Springfield, Whittlesea.

WANTED, several YOUNG MEN for Pleasure Grounds and Wood; wages, 30s. per week, with bothy, vegetables and attendance.—WM. CAMM, The Gardens, Cliveden, Taplow, Bucks.

WANTED, YOUNG MAN for general Outside work; able to take duty.—Apply, stating experience, age, wages required, to D. THOMPSON, Smalley Hall Gardens, Nr. Derby.

WANTED, YOUNG MAN, experienced in Kitchen Garden; able to take duty alternate weeks; one o'clock Saturdays; bothy.—State experience, age and wages required, G. MORGAN, Dale Ford, Sandiway, Cheshire.

WANTED, YOUNG MAN for Pleasure Grounds and Kitchen Garden; state experience and wages required.—Apply G. BALLARD, The Gardens, Birlingham House, Nr. Pershore, Worcestershire.

SMART YOUNG MAN, 17 to 19, for Inside work; bothy and vegetables provided.—State particulars and wages required to J. W., "Westwood," Pendlebury, Manchester.

WANTED, two YOUNG MEN for inside and Out.—Please state, age, experience, and wages required, with good bothy, etc., to WALKER, The Gardens, Locks Park, Derby.

WANTED, YOUNG MAN for Inside and Out; take duty; good bothy, milk, vegetables, attendance; 1 o'clock Saturdays. State age, experience and wages.—RUSE, Folly Farm Gardens, Sulhamstead, near Reading.

WANTED, a SINGLE-MAN for Pleasure Grounds and Kitchen Garden; used to horse mower; wages 37s. a week.—Apply, FRASER, Coombe Hurst, Kingston Hill.

WANTED, YOUNG MAN about 18 for Inside and Out; wages 25s., with bothy, &c.; duty 5s., alternate week.—J. H. EDGE, The Gardens, Orton Hall, Peterborough.

FLORIST DECORATOR (male) required, for Hotel work in London.—Write "DEC.", c/o. Goulds, 54, New Oxford Street, W.C.

WANTED, GARDEN LABOURER, steady, reliable man (single). Wages 30s. per week and room. State age and experience. Good character essential. — Apply, GARDENER, "Rignalls," Great Missenden, Bucks.

WANTED, GARDENER'S LABOURER.—Apply or write, F. BROWN, The Cottage, Worcester Park, Surrey.

TRADE.

WANTED, MANAGER for Nursery (about 40 acres) in West of Scotland; general stock, comprising Forest and Fruit Trees, Shrubs, Roses, Herbaceous Plants, etc., also Glass Houses. Must be thoroughly experienced and energetic; able to control labour, a good correspondent, and accustomed to estimating for contract work. — Apply, stating salary expected, and give full particulars of experience, with copies of Certificates or References, to A. M., Box 9, 41, Wellington Street, Covent Garden, W.C.2.

GARDENERS awaiting situations may obtain temporary employment until suited; good wages.—Apply, JOHN RUSSELL, Devonshire Nurseries, Haverstock Hill, N.W.3.

GARDENER wanted, JOURNEYMAN, unmarried, for this Nursery; also IMPROVER, with one or two years' experience; work almost entirely under glass; good opportunity of advancement for willing, capable man.—FINDLAY BROTHERS, Springhill Nursery, Baillieston, Glasgow.

GARDENERS waiting for situations can fill up their time at £2 weekly.—ROBERT GREEN, 1911, Ltd., 28, Crawford Street, London, W.

GARDENERS, with experience, for Landscape and Jobbing Gardening; wages, 10½d. hour.—Apply, WM. BIGNELL & SON, 48, North Road, Highgate Village N.6.

WANTED, HEAD WORKING FOREMAN, thoroughly experienced in Grape, Peach and Tomato growing for markets, good manager of labour, six acres under glass.—State full particulars, age and wages required to E. BOURGAIZE and Co., Leigh Vineries, Wimborne, Dorset.

WANTED, at once, for our Quarry Farm Nurseries, Rotherfield, a thoroughly reliable and experienced FOREMAN to take sole charge. A thorough knowledge of Roses essential, and must be well up in Shrubs and Hardy Perennials. Excellent 9-roomed house on Nursery.—State wages required, full particulars, with copies of references. WANTED at once, experienced TOMATO HAND; good wages, and fare paid.—MANAGER, Pabo Nurseries, Conway, N. Wales.

WANTED, MAN to grow Tomatos, Cucumbers, Carnations Chrysanths, etc., in quantity. —T. FEWSTER, Stockton-on-Tees.

MARKETS.

COVENT GARDEN, April 23.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

REMARKS:—The prices of coloured flowers have fallen a little since the Easter demand, but those for white blooms remain very firm, owing to the finishing of the French consignments and reduced supplies from Guernsey and Scilly. There is now an abundance of home grown Daffodils also a plentiful supply of Roses and Carnations. To-day, being St. George's Day, red and white Roses are in great demand and prices are firm.

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

CHINESE OR CELERY CABBAGE.

A VERY RAPID GROWING variety of the Cabbage tribe, but very distinct, resembling more a well-grown Cos Lettuce. It has unusual merits, and this delicious vegetable should be given a trial in your garden this season. 6d. per packet. 1s. per oz., free by post, with full directions for culture and use. —The "PREMIER" SEED CO., LTD., Seed Specialists, 117, London Road, Brighton.

Sole Manufacturers:
McDOUGALL BROS., Ltd., Port Street, Manchester.

NOW IS THE TIME TO PLANT.
KELWAY'S LOVELY GLADIOLI FOR AUTUMN FLOWERS.

KELWAY'S FAMOUS GLADIOLI, planted now, produce grand spikes of glorious flowers from August until late Autumn. They are particularly useful for Church decoration during Harvest Festivals, for large Halls and Hospitals, and for decorating the Home when other flowers are scarce.

Extract from a letter from the Rev. ——, —— Rectory, Swanton Abbot, Norwich:—

11-4-19.

"Dear Sirs,—I had a quantity of Gladioli of you a few years ago, and on 2 or 3 occasions in fact—and they have done remarkably well, and have been of great use for cutting for church decoration. The last 3 or 4 years I have required practically nothing else from about the middle of July to October."

They will grow in towns, and we can supply them in all colours for planting now. Do not buy Dutch bulbs but send at once for our special Price List of named sorts to the Retail Plant Department, KELWAY & SON, the Royal Horticulturists, Langport, Somerset.

GENUINE OLD YORK STONE PAVING for Rustic Gardens, Rose Walks, Terraces, etc.; rectangular and irregular as required.—H. BROOK, Quarry Owner, 40, Valley Road, Streatham, S.W.

Cape Grown Bulbs Just Arrived.

THIS grand bulbous plant is, in growth and habit, similar to a Gladiolus, and just as easy to grow, producing spikes about 3 ft. high, covered with flowers of the purest white. Described by the late Sir Trevor Lawrence as "A Gigantic White Freesia."

An ideal plant for cutting, and superb as a pot plant for decorative purposes. Of the easiest culture, flowering in the open about three months from planting, or sooner if planted under glass.

Cape grown bulbs are greatly superior to those grown in other districts.

LILIES IN 1918.

THE passing of 1918 will not have caused the Lily grower the slightest feeling of regret. Neither excess of rain nor deficiency of sunshine meets his wishes, and when one is a concomitant of the other, as was the case last year, he may be excused for harbouring a grievance against the Weather Controller.

His grievance will not be lightened by a retrospect of the weather during several seasons, for it is plain that the country is passing through a series of years wet and cheerless enough to damp the enthusiasm of the most confirmed optimist. But hope lives eternal in the breast of the true gardener and as year after year goes by, each leaving the ground a trifle more sodden than the last, he finds solace in the reflection that the next may prove another 1911. And after all, while it is undoubtedly the case that after several wet years our island has absorbed about as much water as it can carry, we may take comfort from the reflection that this state of affairs is but a phase in Nature's handling of her resources. There is no need to probe very deep into the recesses of one's memory to call up recollections of a period when for some years the summer sun was hot, the winters fair and the earth so parched that ponds, streams and springs dried up, while in many directions the water supply was uncomfortably short.

But though we cavil at the unstable character of our climate, we must not forget that the Lily season of 1918 opened well with a five weeks' spell of fine, dry weather. When this came to an abrupt end early in July, Lilies of all kinds were looking uncommonly well, and though, as it turned out, neither the mid-season nor late species, bespattered by persistent cold rains, had a chance to develop normally, some consolation was found in the fact that the June flowering Lilies had been in better form than for some years past.

This was especially the case with L. tenuifolium, a gentle little Lily that is almost a stranger to British gardens nowadays. Though the reason for this is obscure, it may be because of an unfortunate way the plant has of disappearing, and that is doubtless at the bottom of the legend that the species is naturally short-lived; but as with all the rest except L. Martagon, which will even sow itself and flourish in the cracks of a flagged path, the well-being of L. tenuifolium is more a question of environment than aught else.

In common with all the members of the stem-rooting group, the species needs a sheltering carpet through which the stem

FIG. 99.—LILIUM MEDEOLOIDES IN MR. GROVE'S GARDEN AT KENTONS.

may rise to the sun, and as it is seldom more than knee-high, the carpeting shrub must be dwarf. There is nothing better for the purpose than Muehlenbeckia axillaris, the dwarf Hypericums of the more gentle kinds, or Cotoneaster adpressa. A well-drained, gritty loam suits this Lily; it pines away in holding soils or those in which there is much humus, and is not a plant for shady places; lime seems more or less essential to its welfare.

The bulbs are as hardy as any of the genus and that is saying a good deal. The writer has often left them exposed to severe frost for days at a time and has never observed any ill effects from the refrigeration. As may be seen by reference to Fig. 101, the structure of the bulb of L. tenuifolium is peculiar; it is composed of a few closely wrapped, smooth, fleshy scales, and, so far as I know, there is no other bulb like it in the whole genus, with the single exception of L. cernuum, clearly a relative.

L. tenuifolium is the father of the Lily known as Golden Gleam, a cross-bred plant that did remarkably well in the short allowance of summer vouchsafed to us last year. It inherits the good constitution of its mother, the white Martagon, and is in all respects an excellent garden Lily of medium growth, though a little inclined, under good cultivation, to be top heavy. But this is a fault it shares with almost every floriferous species except those of the Cardiocrinum section in which the stem has the proportions and strength of a miniature mast. A curious point about this hybrid is that though it has not been in existence more than a decade or so, seed comes comparatively true, in the sense that a high proportion of a sowing will develop into hybrid plants and not show that reversion to the mother parent which is so striking a characteristic of hybrid Lilies in general.

So far as the writer's observation goes, Golden Gleam is the only hybrid Lily of which this can be said. As a rule, Lilies of mixed parentage have to be propagated by offsets, bulb scales or stem leaves, and that is why their propagation is such a tedious matter.

Another of the early Lilies that responded to the brief summer of 1918 was L. medeoloides, a Japanese species of rare merit and one with which few amateurs in Britain have more than a transient acquaintance, though it is a common wild plant of the hill-sides in the northern island. Although regularly imported from Japan in pre-war days, and cheap enough to buy, the bulbs are so frail that they seldom recover from the long journey, and to that extent a purchase usually represents money thrown away. But when grown from seed the species is quick to come to maturity, and once it is established, it continues from year to year, quite happy in climatic conditions far removed from those prevailing in its island home.

L. medeoloides (see Fig. 99) is a sparsely leaved plant, and, in point of fact, has far fewer leaves than any other species; except for a straggling upper leaf or two, the few it has are usually arranged wheel fashion about the middle of the slender stem, and it is to this arrangement of the leaves that the plant owes its name, "Kuruma-Yuri," or Wheel Lily.

In its way, the bulb of L. medeoloides is even more peculiar than that of L. tenuifolium, referred to above, and it is unique in the genus. The illustration (Fig. 102) shows the unusual formation of the bulb, made up as it is of a mass of separate scales, each of them minute in itself and articulated. The upper half resembles an Oat and it was this resemblance as well as some confusion between this species and another, that once led to a description of it as L. avenaceum (*avena* = Oat).

Though common enough in the case of American Lilies, the articulation of bulb scales is an exceptionally rare feature in the Asiatic species and it is a singular thing that in this little plant of the Japanese hill sides we find a connecting link between the bulbs—totally dissimilar

alight at night (using about one pint of oil); on sunny days it will be unnecessary in the day-time.

In a week or ten days the plants will appear. Keep them moist with the syringe (of course, using warm water), give a little air in the day-time, and shade as little as possible. When the Melon plants have three or four rough leaves, shift them into 4 in. pots, and use a larger proportion of good loam. At this stage the plants should be kept fairly moist, and freely syringed. Admit air through the roof ventilators and keep the plants warm at night. When the plants are six inches high it is time to shift them into their final quarters, *i.e.*, 11 in. pots. Mix one third of old, well-rotted, sweet manure with good loam and add a sprinkling of quick-lime; pot the plants fairly firmly, and allow room for a final top dressing. Tie each plant neatly to a short stick. As sun heat increases, less and less artificial warmth will be necessary, but beware of cold winds and gloomy days. The Melon plants will soon begin to grow freely, and should still be kept fairly moist. Arrange the pots, six on either side of the greenhouse and turn out all other occupants, as the Melons must now have the house to themselves. Stand each pair of pots in a shallow box containing 3 or 4 in. of old manure and loam, into which the plants will root through the drainage holes. Fix a long cane for the support of each plant from the sides of the boxes to the slanting roof of the greenhouse, and place a little heap of lime round each stem. From now onwards great caution must be used in watering.

The first appearing female blossoms may not be very strong, but as soon as a healthy looking blossom is well open fertilise it with pollen from a male blossom. Do not attempt with the limited root room of a 11 in. pot, and the consequently small plants, to grow more than one fruit to a plant. Pollinate several female blossoms, but the plant will probably determine which one is to develop fruit. Fertilising should be done on the morning of a sunny day when the plants are dry. At this period, while the fruits are just beginning to swell, the roots should be kept rather dry, but as soon as the fruits begin to increase in size rapidly, rather more water may again be given; but now begins the most dangerous period, when a few hours carelessness may undo the work of months. Canker, a disease which attacks the stem of the plant just at the soil level is the terror of Melon growers. It appears to start as the result of over-watering and chill. The lime mentioned above is a precaution against canker, therefore renew it from time to time and do not be afraid to use it. If there is a cold wind, give air only through the ventilator and keep the door shut; even on the hottest days shut the house in good time, and never allow chilly evening air to have access to the plants, or disaster is sure to follow.

Canker shows itself by the drooping of the end shoots of the plant. If a plant is flagging because the roots are too dry, the bottom leaves will droop first. This is easily remedied by shutting up the house, shading a little by means of an outside blind, if necessary, and syringing freely. Watering a cankered plant will only make matters worse, but sometimes the disease may be checked by renewing the lime round the stem, shading and keeping the plant dry. The soil in the boxes in which the pots stand may be kept fairly moist.

When the fruits are as big as an Orange they should be supported on little hanging stages or by little nets. If stages are used they should be perforated or made of little slats in case moisture collects between the fruit and the wood, which may cause rotting and the loss of a fruit.

When a Melon begins to "net" there is no harm in the plants drooping a little during hot sunshine; shut up the house, shade and syringe and the leaves will soon recover. In very hot weather, while keeping the soil fairly dry, syringe the staes and floor of the house freely, shut up early and spray all over the plants.

As the fruits ripen, no further watering is required, but it is a good rule not to let a Melon plant fail from drought till the fruit emits a strong fragrance. When this stage is reached the fruits will complete their ripening equally well on or off the plants.

In this humble method of Melon culture, the use of fertilisers is almost unnecessary, and practically no cutting back or pruning need be done. The points of the laterals may be stopped when they have made a certain amount of growth, and the main stem may be topped when it reaches the roof. When the Melons are swelling quickly a little concentrated fertiliser in liquid form or a top dressing will quickly bring to view new surface rootlets and help the plant. Both may be applied to the soil in the pots and to the soil in the shallow boxes in which the pots stand. *A. W.*

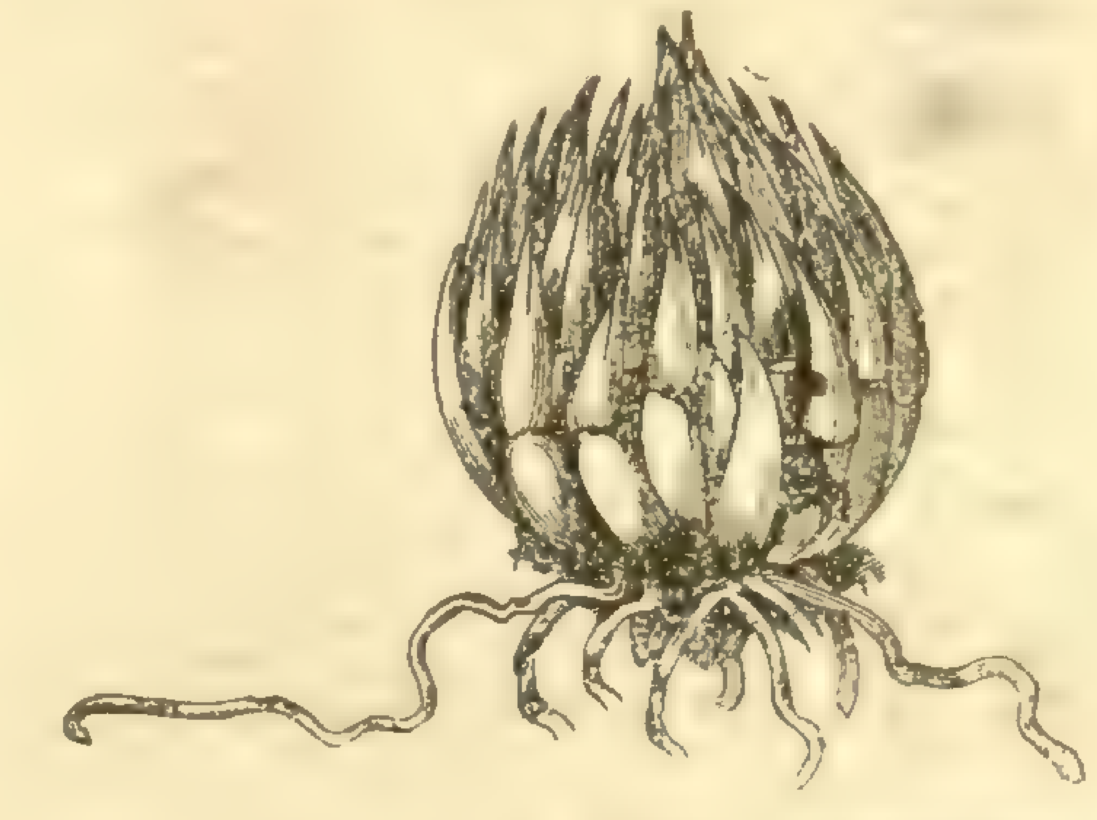

FIG. 102.—BULB OF LILIUM MEDEOLOIDES; NATURAL SIZE. (*See p.* 211.)

LETTERS FROM SOLDIER GARDENERS.

A GARDEN IN WESTERN GERMANY.

GENERALLY speaking, horticulture does not appear to be carried on to any large extent in this neighbourhood (near Duren). The district is a manufacturing one, and does not contain any large residences.

However, at a fair-sized villa garden owned by a German American, I was able to observe to a certain extent the effect of the war on horticulture in Germany, the methods of culture, and the general principles of gardening.

The general effect in design and accomplishment of this garden is a type of massive solidity, which, to English eyes, is rather depressing. The pleasure grounds are divided from the vegetable garden by a small stream, which is conducted down a channel made of concrete. The stream is crossed at points by bridges made of the same material, and in appearance strong enough to bear the weight of a "tank."

The water of the stream is diverted to form a cascade in a small rockery, but its effect is spoilt by the bad arrangement of the rocks and the employment of unsuitable stone; in fact, one gets a similar idea to that given by the hideous conglomeration of clinkers and slag occasionally met with in England.

As regards the plants used, only very ordinary and very adaptable ones remain, partly because the rockery is raised too high and consequently very exposed, and partly because of the dense shade of the overgrown Fir trees, which were originally planted as a background.

Still, in spite of these disadvantages, one notices with pleasure the old favourite Saxifrages, Arabis, Primula, and a few more of the humbler denizens of rock gardens.

The shrubberies are poor and thin, but a few specimen trees of the Silver Fir are in very fine condition and, combined with a fortunately situated clump of Silver Birches, do much to break the monotony, but on the whole the effect is disappointing.

The kitchen garden has next to nothing in the way of vegetables, and what little there is shows a poorness of soil and lack of suitable manure.

Fruit trees are all standards, and have been well tended, being clean and generally in a healthy condition: Apples especially were in first-rate condition.

There are a few beds of Roses, which apparently are greatly prized and receive every attention, but I have not succeeded in obtaining the names of the varieties grown.

The soil, being of a fairly light nature and somewhat stony, seems to require plenty of manure of a substantial nature.

There is one small range of glass-houses, a "lean-to" of three divisions, one of which is the stokehole and potting shed, the other two divisions being heated by the same circuit. There exists no means for regulating the temperature of the two houses other than by ventilation. The heating apparatus is of the modern type, consisting of 3-inch piping and a small, upright boiler. The houses contain nothing of great value, but most subjects are very useful for ordinary decorative purposes.

Up to Christmas there was a very fair show of Chrysanthemums, which were in good condition, although the plants were somewhat shorter in the stem than we commonly see them in England. There was also a pleasing little batch of Carnations of the perpetual-flowering varieties, but they had received no special treatment, and had suffered somewhat in consequence.

At present there is a pleasing blaze of colour from a small batch of Primulas, while a few Begonias of the Gloire de Lorraine type promise well.

The coming season's stock of Pelargoniums for bedding purposes was very fine, the plants being sturdy and short-jointed. A number of Kentia Palms looked in good condition. A few plants of Hippeastrums (Amaryllis) will shortly be in flower, also some Richardias; but the latter seem somewhat starved, although apparently quite healthy and free from sopt disease.

Each house has a Rose trained to the wires; in the one case a Maréchal Niel (still in flower), and in the other a Niphetos. Both trees are healthy, and free from mildew.

Altogether the houses are very interesting, and provide a very refreshing sight after all the weary months when one saw little or nothing of a garden.

There is a certain amount of lawn, but it has been neglected for some time, and is somewhat unkempt.

The paths are well made, stone chippings being the principal material employed in their making. There are several large summer-houses, and one is especially fine, being built of rustic work and thatch, with the interior panelled and decorated in a very tasteful manner, and fitted with electric light and a fire-place. A series of folding glass screens enable the house to be used in winter as well as in summer. It is the best

in themselves—of Lilies on two continents thousands of miles apart.

The plant of this Lily (illustrated in Fig. 99) has an interesting history, for it is the child of a plant that was growing on the hills near Sapporo ten years ago, and, for all the writer knows, may be there now. Walking over the hills one day, Prof. Bayley Balfour espied the ripe capsule of a Lily standing up here and there through the coarse grass, and ever mindful of friends at home, promptly sent a capsule to the writer. In due season a plentiful crop of bulbs resulted, and from one of these, the subject of the photograph springs year by year with a regularity so unfailing as to touch a chord of more than sentimental interest.

But in these days of generous givers, gardens are peopled with plants whose history would fill a book of more than ordinary interest, could it be transferred from the memory of their host or compiled from the ghosts of labels for the most part long since dissolved or indecipherable. Only those who have to deal with them realise how large a part the personal and geographical associations of plants play in the amateur's estimation of them, for the individual who cultivates plants—and under this head one naturally includes trees and shrubs—for the intrinsic beauty and interest so many of them possess, and who is on really intimate terms with them, would be less than human did he not derive added joy from the contemplation of those whose presence conjures up memories of men and places. There can be few gardens or collections of plants—call them what you will—owned by interested amateurs, where at almost every part of the year something does not spring to life to touch a chord of memory's harp.

As usually grown in this country L. canadense is a Lily of moderate stature and none too floriferous. But in sympathetic hands it is capable of great things, as may be seen by reference to the picture (Fig. 100) Mr. Malby has made of the well-balanced head of a fine specimen growing in Colonel Hugh Warrender's garden at Eastcote.

L. canadense is a plant of annual growth in the sense that after producing a flowering stem the bulb dies away. Before its dissolution, however, the bulb throws out a short rhizomatous root, at the end of which a new bulb develops and in course of time reaches the flowering stage. The process is repeated *ad infinitum*, and as each rhizome is a few inches long we find the Lily appearing in a fresh place year by year.

This wandering habit is not an uncommon feature in American species. It is a characteristic, for instance, of L. pardalinum, but in the case of this species the direction of travel of the rhizome is not as a rule more or less straight, as in L. canadense and L. Grayii, but circular, with the result that the rhizome comes round on itself and ultimately produces a mat of bulbs.

The sterility of the cultivated forms of L. candidum has long been a matter of observation by students of the genus, and a great deal has been written on the subject without throwing any light on a puzzling peculiarity. Seed of L. candidum may usually be secured by pollinating with pollen of L. testaceum, but while it meets with a considerable measure of success, the method is by no means a certainty, and the fact remains that, left to themselves, cultivated plants of L. candidum very seldom produce any seed capable of carrying on the race.

It came therefore as a pleasurable surprise to find a number of plants of this species in fruit in Mr. Bowles' garden last autumn. The bulbs from which the plants were growing had come to their host from Salonika, and were representative of the wild form as one knows it in S.E. Europe, virile, but dwarfer and smaller in the leaf than the cultivated L. candidum sent here in such numbers from Northern and Southern France and Belgium.

During the year the trumpet Lily raised from seed collected by Mr. Farrer in Kansu in 1914 has reached adolescence, and, judging by the specimens in Mr. Bowles' garden, is a fine plant. This Lily bears a remarkable resemblance to L. Brownii, an Eastern Chinese species, often reported in W. China but not yet received thence. There are, however, botanical differences, and in any case the bulbs are so unlike that the two plants can hardly be referable to one species. However, whatever it may eventually turn out to be, this fragrant Lily has every appearance of proving a fine garden plant; moreover, the specimens in the garden at Myddleton House have fruited freely, in a season, too, most unfavourable to the process, so that propagation should be easy.

Those who have seriously taken in hand the cultivation of Lilies are aware that many bulbs fall victims to the depredations of insects, and it is probably true to say that where cultivation is on intelligent lines the casualties from this cause alone are greater than from all the rest put together. No bulb is safe, and in casting about for some explanation one is led to the conclusion that it may be found in the fact that bulbs of Lilium are more edible, or at any rate more to the taste of the scavengers of the

Fig. 100.—Lilium canadense in Colonel Warrender's garden at High Grove.

under-world than those of Narcissus, Tulip, Gladiolus, Allium, Iris, Crocus, and the rest, none of which suffers to anything like the same extent.

Hitherto it has been impossible to deal with the nuisance if only because the mischief is seldom apparent until it has been done, and also because there has been no practical remedy. From experiments the writer has made in tentative fashion during the past year there seems good reason to hope that in bi-sulphide of carbon Lily growers have to their hands an instrument of importance in combating the attacks of subterranean enemies, without injuring the bulbs on which they prey.

For a long time past it has been evident that the botanical discoveries of the last 30 years in Western China and the Himalaya have rendered it increasingly difficult to maintain the accepted distinction between Fritillaria and Lilium, and with material crowding in, it is inevitable that sooner or later botanists will have to apply their minds to a subject of which both Hooker and Franchet appreciated the difficulties, though they did nothing to elucidate them. Meanwhile a preliminary step has been taken by Professor Bayley Balfour in an enumeration of Nomocharis*—hitherto a monotypic genus intermediate between Lilium and Fritillaria—and a consideration of the position of the genus in regard to each of the other two.

Through the kindness of Mr. Elwes, seeds of Lilium collected by Mr. Forrest in Yunnan in 1918 have been received, and may perhaps include species not yet known to us.

By the death in 1918 of M. Maurice de Vilmorin, amateur growers of Lilies have lost a friend and ally of the first importance. Though, as was natural, his interests lay more with trees and shrubs, M. de Vilmorin's association with the missionaries and travellers France sends to all parts of the globe led from time to time to his receiving seed of Lilium species from various directions, and especially from Western China.

From seed sent to him by Père Farges in particular, of species from Szechuan and Yunnan, M. de Vilmorin raised a number of Lilies, and as far back as the beginning of the present century had in cultivation at Les Barres a collection of Chinese species that even now would be almost unique, including some magnificent specimens of L. Sargentiæ, at that time known as L. leucanthum, and not systematically in cultivation anywhere else.

As is the way with so many plant lovers, M. de Vilmorin was generous, and for many years never failed to ask the writer's acceptance of a proportion of any Lilium seed that came into his hands. His generosity lost nothing of its savour from association with a courtesy as punctilious as it was natural.

The illustrations of the bulb of L. tenuifolium and L. medeoloides (Figs. 101, 102) are reproduced from *Notes on Lilies*, by Dr. Wallace. *A. Grove, April* 15.

A METHOD OF GROWING SMALL MELONS WITH VERY LITTLE HEAT.

The following notes are only for those who wish to try to grow Melons in a small way.

The principle is to grow small plants in pots, to utilise a limited space to the fullest extent, and to aim at only one fruit on each plant. With a spacious house and plenty of heat and root room, of course several fruits may be grown on one plant, but the method to be described has certain advantages for the small grower. The loss or failure of one plant only means the loss of one fruit. Perfect little fruits weighing about 1½ lb. may be expected. I have succeeded equally well with Sutton's Superlative and Ringleader, but the latter appears to be the more vigorous and hardy, and, though green fleshed, the fruits have a fine flavour.

The appliances available in my case are a small span-roofed greenhouse 6ft. by 8ft. Under the staging at one end is built a little brick chamber, in the roof of which is a small iron cistern, while a 1½in. flow and return pipe run along one side of the house. A light metal door, perforated at the top and bottom to supply air to the stove, gives access to the brick chamber from outside the greenhouse. Inside the chamber is placed a small oil stove, which gives the requisite heat, and no fumes can enter the house.

The house will accommodate twelve plants. The third week in April is quite early enough to commence (unless it is proposed to burn a great deal of oil) as Melon plants should grow quickly and never receive a check.

Place the seeds in thumb-pots in a light, porous compost containing a good deal of leaf-mould. Put them in a propagating box plunged in fibre or leaf-mould on the stage above the hot water cistern, and sow enough seeds to allow for some failures in germination. Keep the stove

*The Genus Nomocharis. Trans. and Proc. of the Bot. Soc. of Edinburgh. Vol. xxvii, part iii.

in good time to prevent crowding. Fig trees, when in good health and carrying heavy crops of fruit, require plenty of water and stimulants. When watering the borders a liberal application of liquid manure will materially assist the fruits to swell, and maintain the health and vigour of the tree. An occasional application of soot water has a beneficial effect in giving good colour to the fruits and foliage. Air should be admitted freely during the day whenever the conditions are favourable. During bright sunny weather the temperature may range from 75° to 80°; the night temperature should be about 65°. Syringe the trees thoroughly at closing time, and damp the borders and bare spaces more or less frequently according to the weather. Young pot trees should be repotted as the plants increase in size. A suitable compost for the purpose is formed of rich, turfy loam mixed with a liberal quantity of old mortar rubble and wood ash.

Plums.—The fruits on Plum trees which were started rather early will now be swelling, and where they are too numerous should be thinned with Grape scissors. Mulching, feeding, and syringings must be continued for some time, as the earliest of crops will have barely passed the stoning period. Clean, soft water only should be used for syringing, as the bloom is easily damaged. Ventilate as freely as the weather permits.

Forced Cherries.—Shortly before the Cherry fruits commence colouring, a good mulch should be applied over the roots of the trees; this will generally supply sufficient nutriment until the crop is gathered. When the earliest varieties show signs of ripening, admit air freely whenever the weather is favourable, and maintain a drier atmosphere. Green and black fly should be kept under by fumigating when the foliage is quite dry.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Disbudding Peach Trees.—Disbudding is essential to good training, as it removes needless shoots and prevents overcrowding and unfruitfulness. Only sufficient growths should be left to fill the available space, in order that all the leaves may be exposed to the light. All shoots not needed should be removed, but it is a great mistake to strip off all the superfluous growths at once, as this would cause a check. By removing a few shoots at a time the sap is gradually diverted to other channels. Disbudding should be done while the shoots can be removed easily by finger and thumb. If allowed to remain until the wood becomes hard, the removal of growth makes a wound, and there is a tendency to tear the bark. In thinning Peach trees it is best to remove alternate shoots at the first thinning, but always leaving the basal and end shoots.

Care of Wall Trees.—Fruit trees on walls now require careful attention with regard to protection from cold winds. A sharp watch should be kept for any signs of blistered or curled leaves on Peach trees. Remove the affected leaves and thoroughly hose or syringe the trees if insects are present, using as much force as possible without damaging the tender leaves. If this work is done regularly there should not be much damage from green fly and red spider.

Apricots.—The Apricot produces its fruit on the preceding year's wood, therefore as much young growth as possible should be laid in without overcrowding. The front and misplaced shoots and any that are not required, should be disbudded as soon as large enough to handle. This is better than leaving them until later, when a knife is needed, as it is best to avoid using the knife on the Apricot as much as possible. Do not permit the roots to become dry, as the Apricot will not succeed in dry conditions; copious supplies of water should be given as soon as the fruits have set. It often happens that, after rains, wall trees are not moistened at the roots, and this is a point often overlooked and frequently the cause of fruit dropping.

THE KITCHEN GARDEN.

By G. ELLWOOD, Gardener to W. H. MYERS Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Early Potatos.—Guard against damage by frost whenever the growths of early Potatos appear, by covering the haulm with fine, dry soil or litter till all danger of frost is over. Continue to plant maincrop Potatos as ground becomes vacant. If the soil is of poor quality, spread a suitable fertiliser in the drills.

Celery.—Seedlings of main-crop Celery should be pricked out on a very firm base, so that the plants may be lifted at planting time with balls of earth and roots intact. To achieve this desired end place two inches of thoroughly decayed manure on a cinder ash base, tread firm, then place over this a three inch depth of equal parts loam, leaf-soil, and grit. Prick out the seedlings 3 inches apart and shade from bright sun for a few days. Pay attention to watering and give regular syringings.

Early Celery.—The batch of Celery raised from the February sowing and now established in boxes will be almost sufficiently hardened off to plant out in well-prepared trenches. The trench should be 8 inches in depth; dig the bottom up with a fork, add some burnt garden refuse if the soil is heavy, over this place four inches of decayed farmyard manure, and tread firmly. With a shovel work sufficient soil from the trench sides to cover the manure four inches deep. On this soil a dressing of old potting compost may be placed to facilitate quick root action. When the trench is complete take the plants very carefully from the boxes and plant them shallowly, and firmly, one foot apart, in single lines for preference. Water them in, damp them overhead when necessary, and give occasional dustings of soot.

Runner Beans.—Make a large sowing of Runner Beans in pots (one seed in each) and boxes. For plants intended to occupy ground that still carries Broccoli, trenches may be taken out as advised for Celery, but in this instance the soil and manure should be mixed as the work proceeds, with the addition of old mortar rubble and wood ash. Plant in double lines, 15 inches apart, as soon as all danger of frost is over.

Haricot Beans.—Sow Haricot Beans in boxes, in light soil, and place them in frames kept close until germination takes place. Then admit air freely, give water as needed, gradually give full exposure, and plant out in double lines after the 25th of the present month.

THE FLOWER GARDEN.

By H. MARKHAM, Gardener to the Earl of STRAFFORD, Wrotham Park, Barnet, Hertfordshire.

Late Planted Flowering Trees and Shrubs.—When the soil is in a fairly dry state tread it firmly over and about the roots of all late-planted trees and shrubs. Afford water as needed, and apply a mulch of suitable material if dry weather sets in. Prune slightly to encourage the formation of shapely heads.

Hollies.—All Hollies may be planted now with every hope for success, but the work should not be further delayed. Plant firmly, supply abundance of water in dry weather, especially on light, porous land, and also apply a good mulching of leaf-mould or old manure over the roots to conserve the soil moisture.

Herbaceous Borders.—Now that the soil is in workable condition, vacant spaces should be filled and the borders hoed freely amongst the plants to destroy all young weeds. Fork out deep-rooting weeds.

Spring Flowering Plants.—As soon as early flowering plants have lost their beauty, remove them and prepare the beds for their summer occupants. Many hardy plants will be required for another year, consequently propagation should not be neglected. Alyssum saxatile, Pansies, Daisies, Aubrietias, and Polyanthuses are among those that need early attention. Alyssums root freely if young shoots are pulled from the parent plant and planted rather deeply on a north border. Polyanthuses may be treated very much the same, and Aubrietias by means of small tufts, keeping each variety correctly named, so as to prevent confusion later. Give water freely in dry weather, and keep the ground free from weeds.

Rose Cuttings.—Make Rose cuttings firm in the soil, first pressing down the cutting so that the end rests on a firm base; they frequently become loosened by frosts, and if not attended to afterwards they fail to root satisfactorily.

Alpine Auriculas.—These useful and attractive spring flowers are not so extensively grown as they should be. Their propagation is not difficult as they are readily raised from seeds or divisions. Seed may be sown in pans or boxes filled with a gritty compost and stood in a frame or in handlights, shaded from the sun. The young plants should be planted on a shady border, and if carefully attended to they soon develop into useful plants. Old plants may be divided after they have finished flowering and the divisions planted rather firmly in good soil on a shady border. If the land is rather heavy, give it a good dressing of burnt earth, wood ashes and soot, and work this in before planting is done.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Azalea indica.—As Azalea plants finish flowering, examine the roots to see if the drainage is perfect, and unless a shift into larger pots is necessary, remove only a little of the surface soil and top dress with fibrous peat. If repotting is done give as small a shift as possible and ram the peaty soil very hard, but first divest the plants of all decayed flowers and dead foliage and dip them in an approved insecticide. After potting place the plants in heat to ensure good growth, and when growth is completed, harden them off gradually preparatory to placing them out of doors for the summer.

Bouvardia.—Bouvardias, which were previously cut back and are now making new growth, should be repotted. Turn them out remove a portion of the old soil, and repot in receptacles no larger than necessary to accommodate the roots. A mixture of equal parts of loam, peat, and leaf-mould, with some sharp sand, makes a suitable rooting medium. Place the plants in a house having a warm, moist atmosphere, syringe them freely, and as they continue to grow pinch the shoots at the second leaf until sufficiently furnished with growths. Larger specimens, and a greater quantity of flowers, may be obtained by planting Bouvardias during the summer in a warm pit. Young stock, either from stem or root cuttings, should be potted into small pots in light, fresh soil, and when growing freely the points of growth should be pinched out, in order to obtain bushy plants.

Caladium.—Caladiums that were started early in small pots should now be ready for their final potting. For this potting use a mixture of loam, peat, leaf-mould and sand, adding some wood ash and dried cow manure. Continue to grow the plants in a warm, moist atmosphere, syringe them after closing the house in the afternoon, and shade them lightly during mid-day. To bring out the bright colours of the foliage it is necessary to allow all the light possible to reach them, but not direct sunshine. When the pots are filled with roots afford liquid manure and pinch out all flower spikes.

Camellia.—Large Camellia plants in borders should receive a thorough cleansing with an insecticide; the border should be well watered, and after the removal of old surface soil a top dressing of fresh loam mixed with a plant fertiliser should be given. While fresh growth is being made, close the house for two hours after 4 o'clock, and give the plants a good syringing, opening the ventilators again in the evening. Attend carefully to watering, and afford occasional supplies of liquid manure. Plants grown in tubs or pots should receive similar treatment.

type of garden house I have seen. A second house, built after the same style outwardly, contains a fair-sized ice chamber built of brick. It is said to be a great success, and is certainly much more accessible than such places usually are.

On the whole, although the war has prevented any progress or improvements in this garden, very little has been allowed to get out of bounds. The chief trouble seems to have been the shortage of manure and, to a great extent, labour.—*S. W. Dance, Cpl., R.F.A., H.Q. 40th Brigade R.F.A., B.E.F.*

ORCHID NOTES AND GLEANINGS.

ODONTIODA MARGARET GATTON PARK VARIETY.

The many forms of Odontioda shown at the meeting of the Royal Horticultural Society on April 8 last afforded an interesting study of the results of introducing the pretty little scarlet Cochlioda Noezliana into the scope of the hybridisers' operations. The variation in colour was remarkable and exceeded all expectation. Amongst the plants was the almost self-coloured Odontioda Margaret Gatton Park variety (see Fig. 103), for which Sir Jeremiah Colman, Bart., Gatton Park, Surrey (gr. Mr. J. Collier), obtained an Award of Merit. The parentage is Oda. Bradshawiae (Odm. crispum × Cochlioda Noezliana) and Odm. ardentissimum crispum × Pescatorei), and in the species used there are no colours to suggest the striking and uncommon dark mahogany-red with a violet shade seen in the hybrid.

The form for which Sir George L. Holford obtained an Award of Merit on February 10, 1914, had a yellowish ground marked with bright red, and that type has been generally followed, C. J. Lucas, Esq., Warnham Court, Horsham, showing a very good example of the cross at the meeting on April 8.

Scarlet selfs are frequent, and, owing to the scarlet colour of Cochlioda Noezliana, scarlet tones are naturally expected. But, as in this case, the production of a whole-coloured flower in a cross usually giving quite dissimilar flowers, having occasionally coloured markings on light ground, proves the individuality of each member of a batch, although the exact means by which such variation in colour is decided is not yet determined.

Another interesting character in Odontiodas was shown at the exhibition on April 8 in the very fine plant of Odontioda Gladys superba (Odm. Pescatorei × Oda. Bradshawiae), for which Dr. Craven Moore, Victoria Park, Manchester, was given an Award of Merit and Cultural Commendation. This plant had two, much-branched spikes of fifty-four flowers, which had a white ground prettily marked with bright red and with mauve margins to the segments. The interesting feature of this hybrid is the production of a much-branched inflorescence such as O. Pescatorei often produces in its mature stage. But proneness to branch in combination with usually simple spikes is common in Odontioda.

LAELIO-CATTLEYA HYMEN.

A first flower of a very pretty hybrid raised by crossing Cattleya Schröderae with the pollen of Laelio-Cattleya Ardens (L. Latona × L.-c. Charlesworthii) is sent by Messrs. Stuart Low and Co., Bush Hill Park, Enfield, the plant having bloomed in their nurseries at Jarvis Brook, Sussex. It is a flower of great promise, the shape and fine substance partaking much of the C. Schröderae parent. The sepals and petals are cream-white, flushed with rose, and have a delicate gold tint over the surface, the midribs and margins of the petals being lighter in tint than the other parts. The prettily-formed, crimped-edged lip is rather darker than the petals, and the base and centre are bright orange colour, the front being tinged with rose. The combination of delicate colours renders the flower very attractive.

Fig. 103.—Odontioda Margaret Gatton Park variety; colour, dark mahogany red.

TWO GOOD ONCIDIUMS.

Oncidium Papilio and O. Kramerianum may be described as constantly flowering, the plants being rarely out of bloom except for a month or so in winter. The wiry peduncles which rise from the base of the pseudo-bulbs bear one flower at a time, and at intervals. The frequent flowering ultimately weakens the spikes, as shown by the smaller blossoms produced, and when this is observed the old spikes should be cut off, when fresh, vigorous ones will soon form. The plants thrive best in a shady corner of the Cattleya house, and they may be cultivated in a variety of ways. Blocks dressed with some rooting material, baskets, and small pans may, any or all of them, be used, the chief point being to ensure a sweet root-run: place little compost about the roots, and carefully avoid a soddened compost. *H. A.*

The Week's Work.

THE ORCHID HOUSES.

By H. G. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Selenipedium.—Plants of this Cypripedium group of Orchids should be repotted without delay, if they need it, as new roots are now starting from the young growths. They should be grown in pots or, in the case of large specimens, in broad and fairly deep pans. In regard to soil, a compost of good fibrous peat or A1 fibre and Sphagnum-moss should constitute the base for all of them, but for the strongest growing kinds, like S. Sedenii, S. Schröderae, S. grande, and S. caudatum, a third portion of good loam fibre may be added with great advantage. Use the materials in as rough a state as possible, and intermix plenty of crushed crocks, charcoal, and silver sand to keep it porous. Care should be taken to provide ample drainage, for when the plants are well established they require liberal supplies of water; it is, in fact, almost impossible to over-water well-rooted plants during the growing season. The most critical time for Selenipediums is that following the potting process, before the roots have taken possession of the new material: for a time therefore, only sufficient water should be given to keep the material just moist. Most of the kinds may be grown in an intermediate temperature, such as that of the Cattleya house, while the cooler intermediate house is warm enough for S. caudatum and S. Schlimii. They all like a shady position, and a constantly moist atmosphere.

Oncidium Marshallianum.—This species is certainly about the most effective cool-growing kind in cultivation. The large spikes of brightly-coloured flowers that rise from strong growths make a grand display, and too much cannot be said in its favour as a garden Orchid. The plants that are now developing flower-spikes should be kept moderately moist at the roots, and care should be taken to remove the flower-spikes within a reasonable period after the flowers have expanded. Should the plants seem inclined to rest after the flowers are past, by all means allow them to do so; but while at no time is a dry rest advisable, much less water is needed at this stage.

Oncidium concolor.—This small, compact-growing species is now flowering, and is a very beautiful cool house kind. The Odontoglossum house suits it very well, and if kept free from insects and in good condition at the roots it seldom fails to flower freely. Being a small grower, it does not need a large amount of compost, and suspended pans are the best receptacles for it. Repotting is best done after flowering, just as the plants commence to grow again. Afford liberal drainage, so that water may be applied freely when the plants are in full growth.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to Major J. A. Berners, Woolverstone Park Gardens, Ipswich.

Figs.—The fruits on early-forced pot Fig trees are ripening, and from now to the time the first crop is gathered a somewhat drier atmosphere is required to develop rich flavour in the fruits and prevent them splitting. Water the roots freely and feed them liberally to encourage the second crop of fruits to develop. All weakly growths should be removed, and the points of the main shoots pinched out when they have made six or seven leaves. The ripening fruits should be fully exposed to sunlight. Planted out trees, intended to supply fruits in succession to pot trees, should be well advanced in growth. The young shoots should be kept closely tied down and superfluous growths removed. After the first pinching, more young shoots generally form than are required, and these should be thinned

Grosvenor and Ecklinville Seedling. Mid-Season and late cookers: Warner's King, Blenheim Pippin, Newton Wonder, Lane's Prince Albert (on crab stock), Bramley's Seedling, and Mère de Ménage. Annie Elizabeth bears well in the bleak districts in the north of the county. Of dessert Apples the best are Worcester Pearmain, Allington Pippin, King of the Pippins, and Blenheim Pippin.

A New Preservative for Wood. — The makers of the new Esitol Wood Preservative claim that the basic colours in which it is put up are fast colours, unbleachable by the sun, unaffected by water, and proof against insects of all descriptions. Further, neither horses nor cattle will gnaw or bite the wood after treatment. It is manufactured in soluble powder form, and 1 lb. dissolved in water makes two gallons of liquid preservative.

Ammonium Nitrate. — *The Journal of the Board of Agriculture*, No. 12, March, 1919, draws attention to the offer by the Ministry of Munitions of ammonium nitrate at £25 per ton, at which price it is easily the cheapest nitrogenous fertiliser on the market. When applying the appropriate dressing of ½-cwt. per acre, the fertiliser should be mixed with dry earth or ashes, or, if it is to be applied, dry superphosphate.

Food Production in India.—The Agricultural Department of India estimates * that by the general use of a pure line Rice raised by the Agricultural Station at Decca, the Rice crop of Bengal would be increased by 500,000 tons. In general the view taken by the Department is that throughout India great increases in food production may be achieved by the general use of improved strains of seed.

Rismollan (Chenopodium Quinoa).—According to trials made by a Swedish farmer,† Chenopodium Quinoa, a South American food plant, has been grown successfully for its grain, both in Germany and in Sweden. The ripe grain is readily threshed, and may be milled into flour and cooked as porridge. The grain is rich in food materials, containing 14.88% of protein, 6.84% of fat, and 52.6% of starch. The yield is said to be remarkably high.

A Potato Hybrid.—Dr. MacDougal records‡ the production of a fertile hybrid between the domestic Potato (Solanum tuberosum) and the wild Potato of Arizona (S. Fendleri). The general features of the hybrid, even to the third generation, are those of the smaller wild parent, and the hybrids as yet have produced tubers only of small size. It is noteworthy that the tubers of seedlings do not reach their maximum size until propagated vegetatively for two or three generations.

Bulletin of Peony News.—The proceedings of the American Peony Society are recorded in Bulletin No. 7, published by the Society. Among other items of interest to Peony growers is a symposium on a general list of Peonys, and a protest against the prohibition of imports of horticultural plants into the United States. The protest is a reasoned one, and in it is the prediction that the prohibition will seriously reduce nursery business in the Eastern States. The Society proposes to deal with the subject at greater length in the next issue of the Bulletin.

Ceylon Agricultural Society's Year Book.—The Secretary of the Ceylon Agricultural Society has brought together a very useful mine of information in its Year Book for 1920-21. It opens with general information about the island—area, population, rainfall and temperature, plant imports and exports—chiefly interesting in showing that in spite of its fertility Ceylon finds it necessary to import Rice to the value of over 59 million rupees, and also that the value of Rubber is now half as much again as that of Tea. Then follows a list of the gardens, including demonstration gardens and experiment stations. Besides the Government Botanic Gardens of Peradeniya, Hakgala (near Nuwara Eliya) and Heneratgoda (not far from Colombo), there are now four experiment stations, twelve demonstration gardens, and 315 school gardens. In addition to the usual information as to planting, measures, weights, etc., the Year Book contains hints on the cultivation of food products, on Rubber planting, notes on tools and manures, general horticultural notes, notes on livestock, the control of pests, and—by Mr. H. F. Macmillan—rules for agri-horticultural shows. The Year Book is a credit to the Society, and should prove of real value in promoting a knowledge of agriculture and horticulture in the island.

Rose Christine (See Fig. 104).—In his notes on a Review of the Yellow Roses (see p. 92), *White Rose* described Christine as the brightest new Rose shown in 1916, and gave the colour as rich golden yellow. The variety was exhibited by the raisers, Messrs. S. McGredy and Son, at the autumn show of the National Rose Society on September 19, 1916, and was awarded a Gold Medal. In the *Rose Annual* for 1917 Christine is described as "a very fine Rose, of vigorous bushy habit, free and uniform, with stout and glossy foliage, which is mildew proof. The blooms, which are freely produced and of faultless shape, are carried on long stiff stems, well above the foliage. They are very sweetly scented." The raisers describe the novelty as a great improvement on Rayon d'Or, the colour being deeper and richer, and the blooms larger. Another advantage claimed for this Rose is its suitability for bedding purposes, as it possesses a very robust constitution, has a desirable habit of growth, and is exceedingly free in flowering. Being a Hybrid Tea variety the foliage is glossy and of considerable substance. The illustration in Fig. 104 shows that the buds are of very pleasing form and suitable for decorative purposes.

FIG. 104.—ROSE CHRISTINE, A NEW HYBRID TEA VARIETY OF GOLDEN YELLOW COLOUR.

Griselinia littoralis for Planting in Shade.—A note in *Irish Gardening* (April, 1919) draws attention to the value of Griselinia littoralis, a New Zealand ornamental evergreen shrub, for planting in shady places. Success may be counted on if strong, well-established plants are used, and if during the first season two or three good drenchings with water are given.

Message from Belgian Orchidists.—At the meeting of the Royal Horticultural Society on Tuesday last, Sir Harry J. Veitch read to the members of the Orchid Committee a letter he had received from Mons. Lambeau, President of the Belgian Orchid Society, in response to the greetings and good wishes sent by the Committee on March 11, 1919. The substance of the letter was as follows: "I have had the honour of communicating to the Council of Administration of the Belgian Orchid Society the motion which your Committee has kindly sent us. My colleagues, who were very much moved at the feelings you expressed concerning the members in particular, and Belgian orchidists in general, wish me to express their thanks for such a spontaneous manifestation of sympathy. Although the collections of Orchids in our country have not made much progress during the period of the war, when everyone here was in great trouble and difficulty, I am confident that interest in Orchids will soon revive as a result of will and work. We hope that our cordial relations with English orchidists will endure in the future."

EDITORIAL NOTICE.

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

SALES FOR THE ENSUING WEEK.

WEDNESDAY—
Herbaceous Plants, Rhododendrons, Carnations, &c., at one o'clock; Japanese Lilies in cases at 2.30 o'clock.
The goodwill of Thomas S. Ware (1902), Ltd., and Cups and Medals at 4.30 o'clock. Protheroe & Morris, 67-67, Cheapside, E.C.
The collection of Cattleyas formed by Harry Worsley, Esq., of Haslingden, at the Coal Exchange, Manchester, at one o'clock, by Protheroe & Morris.

FRIDAY—
Topiary work, Garden Furniture, Tubs, &c., by Protheroe & Morris. Orchids, Established and in Flower, by Protheroe & Morris, 67-68, Cheapside, at one o'clock.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 50.7°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, Wednesday, April 30, 10 a.m.: Bar., 30.2; temp., 47°. Weather—Dull.

The Entertainment Tax and Horticultural Shows. IT could certainly never have entered the mind of the person who devised the entertainment tax that it would be applied even in war to such useful and educational meetings as horticultural shows. For everyone, except the hopelessly urbanised, knows that a flower show is one of the most valuable methods of fostering the love of plants and skill in cultivating them. This love and skill are national assets; as indeed the war has amply proved. By common consent they are to be encouraged, and yet—those who seek to encourage them find their efforts impeded by the tax. During the war, when matters of great and vital moment were at issue, it would have been almost as foolish to oppose as it was to impose the tax, but now that the stress of war is relieved everyone must agree that this impediment to the holding of flower shows should be removed. For it will be universally conceded that it is the function of the State to encourage everything which tends to cultivate a love of nature and an interest in the land. A State which is desirous of resettling people on the land will neglect no means of making the countryside attractive. But unless there are an intelligent love of plants and animals and a skilled pleasure in their cultivation and raising, the countryside is bound to seem a dull place; and indeed is bound to be a dull place. Stamp out the natural love of plants which is rooted deep in the country population, and they are bound to flock the faster to the towns. It would, of course, be a foolish exaggeration to say that flower shows will alone prevent the exodus from country to town; but it is no exaggeration to say that they are among the means which tend to kindle and keep alive that love of Nature without which the countryside has no attraction.

There is yet another aspect of this subject which deserves consideration. The industry of horticulture has had perforce, to make heavy sacrifices during the war. The volume of horticultural trade was restricted partly owing to the reduced demand for flowers and plants and partly because nurserymen and florists turned a considerable part of the ground and glass of their holdings to the purposes of food production. The industry which with much public spirit used its resources for the national benefit deserves special consideration and encouragement now that the war is over. Hence, not only should the tax be removed from the little flower shows, the holding of which helps to break the monotony of a country life, it should be removed also from the big shows which give those engaged in the horticultural industry an opportunity to exhibit the products of their skill and enterprise.

An Untoward Spring. The Arctic weather of last week end came as a climax to one of the most unfavourable springs experienced during recent years. Ever since the advent of the Nwe Year gardening work out of doors has been hindered by uncongenial weather, and although the amount of frost has not been exceptional, the weather has been sunless, with an excessive amount of rain that has hindered ground operations and caused work of every description to be in arrears, so that many crops, which in normal seasons would have been already in the ground, have not yet been planted. Wise gardeners know the great harm that is done to ground by digging it when it is surcharged with moisture, and therefore defer the operations of digging and trenching until the soil is in a suitable condition for working. All good cultivators realise that it is essential to sow and plant crops when the ground is in a workable condition and that but poor results follow early planting in soil that is more or less water-logged. But late sowing and planting, especially in spring, mean the loss of valuable time and the crowding of as much work into a few weeks as should, in ordinary times, be spread over as many months. Moreover the garden staff is, in most establishments, so depleted owing to the unusual times experienced, that we fear many arrears cannot be overtaken except at the expense of efficiency. The war, however, has taught us many salutary lessons, and amongst them the art of temporising, but notwithstanding this, we cannot expect to meet with so great success as when well proved and recognised measures are adopted. Some little consolation in the backwardness of the season was derived from the fact that fruit trees promised to flower very late, and would therefore stand a better chance of escaping damage by frost. Quite recently it seemed as though spring was really with us at last and fruit trees of all kinds responded to the warmth, making haste to expand their belated blossoms. Plum, early Pear and early Cherry trees put forth a wealth of blossom during the few fine Easter days, but their haste to flower was soon countered by a chilling wind from the north-east which continued for a week or more, until the climax was reached on April 27, in one of the worst blizzards accompanied by much snow, we have had for many years. In some cases the fruit trees were stripped of their flowers and tender foliage, and much havoc has been wrought in orchards and gardens in all parts of the country. The prospects of a fine crop of the small fruits were unusually good, but we fear Gooseberries and Currants have experienced a severe check and that much damage has been done generally to fruit crops. The advantages of natural or artificially provided shelter for fruit trees will be more apparent than ever this season, and it will be interesting to learn the relative amount of damage done in gardens and orchards that are sheltered and in those that are fully exposed to keen winds; and also the measure of protection the trees afford each other when they are planted in blocks as in large commercial orchards and plantations. It is to be hoped that the Apple crop will not be adversely affected, for only in very favoured districts were the earliest Apple trees in bloom. But there are fears that many of the clusters of buds on the point of expanding have been seriously damaged. Certain varieties of Apples are naturally very late in blooming, Court Pendu Plat for example, which derives its local name of Wise Apple from this fact; and the variety illustrated in Fig. 96, in the last issue of the *Gardeners' Chronicle*, known as Sure Crop, is so-called for a similar reason. A race of these late blooming Apples would be a great acquisition and raisers of new varieties might well turn more of their attention in this direction. An abundant fruit year would be of inestimable value to the country, as fruit is a necessary food, and if the home crop fails we must look to sources abroad for our supplies, which would mean not only tonnage, which can ill be spared, but also the transference of money from this to other countries, which would have its effect, however small, in lowering our rate of exchange. The damage to spring flowers, although not of such great economic importance as in the case of the fruit crop, has been very widespread and the spring-flowering bulbs which were at their maximum beauty have been battered to the ground and irrevocably ruined. The loss in this direction will prove severe to commercial growers of Daffodils, early, and especially the Darwin, Tulips and other spring flowers, as the weather has ruined what promised at one time to be a most successful season.

Public Park for Padiham.—Mrs. S. J. Smith, who died a short time ago, bequeathed the sum of £12,000 for the provision of a public park at Padiham. If the local authorities refuse to provide and maintain a public park, the money is to be used for a new church at Padiham.

Demonstration Fruit Plots in Staffordshire.—The Report for 1918 of the Staffordshire Education Committee's County Fruit Plots and Demonstration Allotment Gardens shows that the work of encouraging intelligent planting of fruit in the county is being carried on actively by the Education Committee. In Staffordshire there are now five fruit demonstration stations, three demonstration orchards on county small holdings, and 18 fruit plots attached to evening school gardens. One of the chief objects of the plots is to demonstrate the varieties most suitable for planting in different parts of Staffordshire. Varieties of Apple that are found to thrive generally throughout the county are:—Early cooking varieties: Early Victoria, Lord

Beauty of Tremough type, but far less brilliant.

R. Xenia.—The parents of this light-hued variety are R. Helen Schiffner and R. Mrs. Chas. Butler. The habit of the plant is good, and the flowers are campanulate, in medium-sized trusses, white, with light chocolate spotting over the interior. All the foregoing Rhododendrums were shown by T. Lowinsky, Esq., Sunninghill, and each was represented by a fair-sized plant in a large pot.

GROUPS.

A large group of mollis Azaleas exhibited by Messrs. R. and G. SOUTHGATE was much admired, and especially the varieties Daviesii and Unique (deep yellow) (Silver Banksian Medal). Azaleas were capitally shown by Mr. L. R. RUSSELL, the rosy-red variety, Fred Sander, attracting general attention (Silver Flora Medal). Miss WILSHIRE (gardener Mr. J. Fitt), The Frythe, Welwyn, put up a small group of lovely flowers of white and deliciously fragrant Rhododendrum fragrantissimum — an old garden favourite (Bronze Banksian Medal).

Gill's Triumph was the centre of attraction in a large group of Rhododendrons shown by Messrs. R. GILL AND SON; it was a glorious display, and included R. Thomsonii, R. argenteum, R. Dalhousianum, R. Beauty of Tremough, R. Nuttallii, and R. arboreum album (Silver Flora Medal). Messrs. PAUL AND SON brought up several Rhododendrons, and the one named Janet Paul, with a fine truss of bright bluish blush flowers, was very distinct. Some interesting Rhododendrons were exhibited by Mr. G. REUTHE, together with Viburnum Carlesii, Adonis amurensis, Myosotidium nobile, and alpine Auriculas (Bronze Flora Medal).

Mr. J. CROOK, Camberley, Surrey, showed a wide selection of coloured Polyanthuses, including a very bright, rich red that approaches scarlet more nearly than anything we have seen.

A wonderful range of colour forms of Primula Eureka hybrids was shown by ADELAIDE DUCHESS OF BEDFORD (gardener, Mr. Dickson), Woodside, Chenies; there were pale pink, salmon, almost crimson-rose, deep rose, and rose purple shades: the flowers were of large size. (Bronze Flora Medal).

Alpine and other early spring flowers were shown largely by Messrs. J. PIPER AND SON, their principal features being Primula Juliae, P. Sieboldii, Aubrietias and Auriculas (Silver Banksian Medal). Messrs. R. TUCKER AND SONS were awarded a Bronze Flora Medal for alpines. Mr. G. W. MILLER had a very bright and large group of Polyanthuses, coloured Primroses, Saxifrages and Crown Imperials (Silver Banksian Medal).

Miss C. WARNER (gardener, Mr. H. Stevens), Hawkhurst, exhibited a few dozens of very fine spathes of Richardia aethiopica (Bronze Flora Medal). Messrs. H. B. MAY AND SONS associated Ferns with Hydrangeas, Cinerarias and Calceolarias (Silver Banksian Medal). Messrs. J. CHEAL AND SONS contributed flowering branches of Berberis, Pyrus, Erica and Cytisus in variety (Silver Banksian Medal).

The perpetual Carnations exhibited by Messrs. STUART LOW AND CO. included fine flowers of the showy Mephisto; these were associated with various Acacias in flower (Silver Banksian Medal). Messrs. ALLWOOD BROTHERS were also exhibitors of Carnations, and their group contained several vases of the handsome Mary Allwood (Silver Flora Medal). Messrs. WM. CUTBUSH AND SON exhibited perpetual and Malmaison Carnations in variety (Bronze Flora Medal).

Orchid Committee.

PRESENT: Sir Harry J. Veitch (in the chair), Messrs. Jas. O'Brien (hon. secretary), W. H. White, W. Bolton, Fred. Sander, S. W. Flory, C. J. Lucas, W. J. Kaye, T. Armstrong, E. R. Ashton, R. G. Thwaites, Frederick J. Hanbury, R. A. Rolfe, Arthur Dye, H. J. Chapman, and R. Brooman White.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontioda Lady Veitch (see Fig. 105) (*Oda. Cooksoniae Orchidhurst variety* × *Odontoglossum Mars*) from H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), raised by Messrs. Armstrong and Brown. The grandest Odontioda produced up to the present, and one which exceeds the highest expectation of the enthusiastic hybridists of the early days of the development of crosses with Cochlioda Noezliana. The flower, in size and shape, excels the model type of O. crispum, all the segments being nearly equally broad and of fine substance. The sepals and petals are rich Indian-red, with a gold flush and narrow white margin. The lip is ruby red in front of the yellow crest.

AWARDS OF MERIT.

Odontoglossum The Tiger (Lawrenceanum × Stella), from H. T. Pitt, Esq. One of the finest of the hybrids of O. triumphans, which is the leading species in its composition. The novelty, while retaining the characters of the finest O. triumphans, exceeds them in size, width of petal, and general effect. The ground colour is yellow: the inner parts of the segments are heavily marked with brownish-red.

Odontoglossum Ashtonii (amabile × hybrid unrecorded), from E. R. Ashton, Esq., Camden Park, Tunbridge Wells. A beautiful hybrid. The large flowers have a pure white ground, and the inner two-thirds of the segments are finely blotched with dark purple, the central blotching of the petals having a surrounding band of the same colour. The plant bore three blooms.

Odontoglossum Radiant, var. Marion (Dora × Alexandrae), from Messrs. Flory and Black, Slough. A fine flower, heavily marked with violet-purple, with blush-white blotches on the tips and margin, the lip being of a lighter tone and effectively spotted.

Cattleya Rajah (Enid × Empress Frederick) from Messrs. Stuart Low and Co., Jarvisbrook, Sussex. A handsome flower of large size, true to its large-flowered Cattleya lineage. The sepals and petals are clear rose colour, and the finely-formed lip has a bright ruby-purple front.

PRELIMINARY COMMENDATION.

Odontioda Signor Orlando (Odm. Jasper × Oda. Bradshawiae), from Messrs. Armstrong and Brown, Orchidhurst, Tunbridge Wells. A large, showy hybrid, with the outer parts of the segments light violet colour, the inner halves being white, beautifully marked and blotched with claret red, lines of which colour also extend from the base of the column.

GROUPS.

SIR JEREMIAH COLMAN, Bart., Gatton Park (gr. Mr. J. Collier), staged an interesting group, in which were the new Odontioda Princess Bibesco (Oda. Chanticleer × Odm. eximium), Coelogyne Sanderae, with five spikes, a fine specimen of the little white Odontoglossum Oerstedii; the orange-coloured Polystachya paniculata, from Uganda, a profusely-flowered plant of Dendrobium Brymerianum, with yellow flowers, having deeply fringed lip, and a very fine selection of cut specimens of Gatton hybrid Dendrobiums.

H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), was awarded a Silver Banksian Medal for a select group of hybrid Odontoglossums and Odontiodas. The centre of the collection was occupied by fine Miltonias including M. Venus, Hyeana, forms of Bleuana and Charlesworthii, with showy Odontoglossums, including the prettily-spotted O. Pescatorei Duchess of Westminster.

E. R. ASHTON, Esq., Camden Park, Tunbridge Wells, was awarded a Silver Banksian Medal for a group of good and excellently well grown Odontoglossums and Odontiodas.

FIG. 106. FIRST PRIZE EXHIBIT OF WHITE TRUMPET DAFFODILS AT THE MIDLAND DAFFODIL SOCIETY'S SHOW.
(See p. 220.)

MRS. NORMAN C. COOKSON, Oakwood, Wylam (gr. Mr. H. J. Chapman), showed the pretty, new Odontioda Chapmanii (Oda. Bradshawiae Cookson's variety × seedling unrecorded), with a fine spike of red flowers which have light margins; Odontioda Florrie (Bradshawiae × Vuylstekeae), a fine red-purple flower, with glossy sheen; a grand form of Odm. ardentissimum, Oda. Clive, Oda. Oakwoodiense, and a remarkable hybrid Odontoglossum resulting from Odm. splendidissimum × Odm. Pescatorei, in which the general characters were of a blush-white spotted O. Pescatorei.

MESSRS. ARMSTRONG & BROWN, Orchidhurst, Tunbridge Wells, were awarded a Silver Gilt Flora Medal for an extensive group of beautiful hybrid Odontoglossums and Odontiodas, in great variety, with which were finely-coloured and white Miltonias, Brasso-Cattleya Cliftonii, B.-C. Excelsior, and some Laelio-Cattleyas.

MESSRS. CHARLESWORTH & CO., Haywards Heath, were awarded a Silver Gilt Flora Medal for an extensive group of Odontoglossums and Odontiodas. In the centre of the collection were varieties of their handsome Miltonias, Charlesworthii, Lyoth, and Bleuana.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Shamrock (page 208).—The following note, under Oxalis Acetosella, to be found in Luxford's fascinating little *Flora of Reigate*, 1838 (p. 40), may be of interest to Mr. C. Nicholson in his quest:—"It is not improbable that this plant is the original Irish Shamrock, as Mr. Bicheno has ingeniously argued, in a paper read before the Linnean Society a few years ago."—*C. E. Salmon, Reigate.*

——It is quite possible that the Wood Sorrel (Oxalis Acetosella) may have been the original Shamrock of the Irish (see pp. 160 and 208). It is abundant in Irish woodlands, and comes quite close to towns and thickly-inhabited places, where the soil is fairly moist, somewhat shady and otherwise suitable. Its Irish name is Seamrog, and the Gaelic Seamrag. In *Hooker and Arnott's British Flora*, under Oxalis Acetosella, the following passage occurs: "This appears to be the original Seamrog or Shamrock of Ireland; although the name has long been applied to the much less beautiful Trifolium repens or Dutch Clover, both in the Irish and Gaelic languages." Gaelic and Irish names for the White Clover (T. repens) are Seamar bhan, Sameir, Siomrag, Seamrag, and Seamrog. In ancient Irish literature the name is spelt in many other ways. In the *Itinerary* of Fynes Moryson, written in 1599, in a description of the Irish, it is said: "They willingly eat the herbe Schamrock, being of a sharp taste, which, as they run and are chased to and fro, they snatch like beasts out of the ditches." The sharp taste here mentioned gave rise to the belief that Watercresses were meant, but others assumed that a three-leaved plant, with a sharp taste, must have been no other than the Wood Sorrel. St. Patrick is believed to have lived about 377 A.D., yet, apparently, the legend of the Shamrock in connection with him does not appear in the literature of Ireland till 1681. In such circumstances the difficulty of fixing the identity of the original Shamrock is great. Trifolium minus has been adopted as the Irish Shamrock within the last twenty years or so; and was cultivated, ready to welcome the Irish warriors as they returned from the Boer War.—*J. F.*

Rust of Parsnips.—In many parts of the country Parsnips are damaged or destroyed to a greater or less extent by what is termed rust. This is not caused by any specific organism, either animal or fungus, but is the result of a number of concomitant causes, amongst which animal pests are the most numerous. Parsnips are usually sown early, and keep growing throughout the summer, until seriously checked by a period of drought. They then crack in a variety of ways, either transversely or longitudinally, and the cortex, or thick outer rind, is unable to heal the exposed portions, which the Carrot can do. The soft interior of the Parsnip is then exposed to a great variety of soil pests, and decay results from the two forms of injury, the flesh at the same time assuming a rusty colour. In my experience, Julus pulchellus is the most troublesome soil pest, apart from slugs. One remedy is to reduce the pests by trenching, and the judicious use of lime and soot. Another is to sow the Parsnips late, so that the drier and warmer periods of summer will have passed by the time the roots are in full growth, and likely to escape the check caused by drought. Last year I sowed them on April 29, on a border having plenty of soil pests, but had good roots, with very little rust, and Julus pulchellus was the only offender. *J.*

National Gladiolus Society.—A circular has been sent by the Committee of the National Gladiolus Society to the members regarding the position of the society, and recommending its dissolution owing to the resignation of the secretary and lack of general support. There is admittedly scope for a Gladiolus society, and the much needed work of classification and registration has already been begun. It would be a pity that this should come to an end, and as one of the founders of the society I venture to appeal to lovers of the Gladiolus to support it. The resignation of the secretary, Mrs. Atkinson, to whose energy and ability so much of the good work done by the society since 1911 is due, is unfortunate. It will perhaps be difficult, but should not be impossible, to find another secretary to undertake the duties, and carry on the work and its future developments. The lack of support is only comparative, though it is true the society has not obtained such wide and general support or so large a membership as was hoped for and expected. But before dissolving the society on these grounds, would it not be best to look for the possible causes of them, and endeavour by an alteration of policy and an appeal to wider interests to increase the membership. First and foremost, I would urge that the amateur interest should be more largely represented on the Council or Committee. At present the whole eleven members of the Council are representatives of trade interests. At least one half should be representative of amateur interests. It is the amateur and general gardener who ultimately find the money, and they cannot be expected to take an interest in the society unless they have some opportunity of influencing its policy. At present less than 30 per cent. of the subscribers are amateurs, and of the remainder more than 60 per cent. are of foreign nationality! I think that the society should be made as truly national in effect as its title implies, and though all might be welcome to join as general subscribers, participating in all the advantages offered by the society, the Council should be composed of members of British origin only. Other details of policy which might conduce to a wider popularity and support are properly matters for the consideration of the Council or Committee, and I will only refer in a general way to one which I think is the most important of all. At present too much prominence is given to the florists' or exhibition varieties, whereas the general gardening public are more interested in the less formal and more easily grown border varieties. A first-class border variety is as deserving of honour as a first-class exhibition variety, and should receive equal recognition and awards. At the shows there might well be many more classes for the border varieties, since they include several more or less distinct races. I think I may claim to speak without bias, for I am a florist myself, and my whole interest is in the individual flower; but I can appreciate the other point of view, i.e., that of general decorative effect. *A. J. Bliss.*

(See Awards by the Orchid Committee, p. 219.)

SOCIETIES.

ROYAL HORTICULTURAL.

April 29.—In spite of the inclement weather of the previous week end and a by no means spring-like day the London Scottish Drill Hall, Buckingham Gate, was well filled with exhibits on this occasion, and from noon to nearly closing time the hall was crowded with visitors. The meeting was larger than usual as the National Rose Society and the National Auricula and Primula Societies held small shows in conjunction with the R.H.S. meeting.

Floral Committee.

Present:—Messrs. H. B. May (in the chair), W. J. Bean, R. C. Notcutt, Sydney Morris, John Green, H. Cowley, G. Harrow, John Heal, W. Cuthbertson, W. Howe, Thos. Stevenson, C. R. Fielder, J. F. McLeod, H. R. Darlington, Arthur Turner George Paul, J. W. Moorman, C. Dixon, W. P. Thomson, E. F. Hazelton, Jas. Hudson, J. W. Barr, E. H. Jenkins and Rev. F. Page Roberts.

Awards of Merit.

Aubrietia rosea splendens.—A free-growing variety with large, rounded flowers of a rich deep and bright rose shade with a satiny sheen. This should prove a very useful plant for spring displays where rose colouring is needed, as it is far finer than the type.—Shown by Mr. M. Prichard.

Rhododendron Mrs. Adelaide Clow.—This is a white, free-flowering variety (White Pearl × Aucklandii), with a few chocolate spots on the upper segment. The flowers are tubular, wide mouthed and with frilled margins. The leaves are comparatively narrow, deep green, with paler margin, and the habit of the plant is good.

R. Mrs. Tom Lowinsky.—This is the result of the same cross as the foregoing, but it differs therefrom in having a rather straggling habit and large, flattish, white flowers slightly flushed with blush at the base on the outside.

R. Mdme. G. Verde Delisle.—A showy variety derived from a cross between R. Doncaster and R. Aucklandii. The plant is of erect habit and bears large, flat, green leaves. The flowers are broadly campanulate, slightly nodding, in loose trusses, and their colour is pale pink with brighter flushing at the margins. This is of

Favourite, Glory of Noordwijk and promising seedlings. 3rd, Mr. W. B. CRANFIELD.

Six varieties of Yellow Trumpet Daffodils.—1st, Mr. F. H. CHAPMAN, Rye, with richly coloured flowers of Bravo, Rampant, Charger, Desperado, Seahorse and Greatheart. 2nd, Miss POPE, whose blooms of Van Waveren's Giant, Kings Norton and Surprise were very meritorious. 3rd, Mr. J. MALLENDER, Scrooby.

In a class for 6 white Trumpet Daffodils, Mr. CHAPMAN again led with handsome specimens of Aunt Maria, Calibre, and four unnamed varieties. 2nd, Mr. ROBINSON.

Six bicolor Trumpet Daffodils.—Miss POPE led with grand flowers of Glory of Noordwijk, Judge Bird, Middleton Favourite and 3 unnamed seedlings. 2nd, Mr. J. MALLENDER.

Six Incomparabilis varieties.—1st, Mr. W. B. CRANFIELD with Noble, Royalty, Solleret, Grenade, Croesus and Lemon Queen. 2nd, Miss POPE, whose best flowers were Victory, Homespun and Estelle.

Six varieties of bicolor Incomparabilis.—Miss POPE beat 5 contestants with flowers of Orangeman, Lucifer, Chryseis, Bernardino, Lady Mary Boscawen, and a seedling numbered 24. 2nd, Mr. BUNCOMBE, whose flowers of Whitewell, Chryseis and Lady Moore were very choice. In Mr. A. ROBINSON'S 3rd prize stand we noted a beautiful bloom of Great Warley.

The best six Barrii varieties were shown by Mr. F. H. CHAPMAN, who had shapely flowers of Concord, Orange Gem, Crater, Brusque, and two unnamed varieties. 2nd, Rev. T. BUNCOMBE, whose exhibit included a splendid vase of Coeur de Lion. Mr. F. H. CHAPMAN was also successful in the class for six bicolor Barrii varieties. His flowers of Shrove, Harold Finn, Philtre, Torsa, and two unnamed seedlings were particularly good and beautifully fresh. 2nd, Rev. T. BUNCOMBE. 3rd, Miss POPE.

In the class for six varieties of Leedsii, Division 4A, there were seven splendid exhibits. The 1st prize was won by Mr. W. B. CRANFIELD with Cockatrice, Miss E. M. Bowling, Helmet, Anthea, Lord Kitchener and Potent. 2nd, Rev. JOSEPH JACOB, Whitchurch, who showed good blooms of The Hon. Mrs. Francklin, Pioneer and White King. Mr. W. B. CRANFIELD also won the 1st prize in the class for six varieties of Leedsii, Division 4B. He staged Katherine, Spurrell, Evangeline, Diana and St. Olaf in perfect condition. 2nd, Mr. A. ROBINSON, whose finest flowers were Molly Bawn and White Slave. 3rd, Mr. J. H. PADLEY.

Mr. F. H. Chapman was awarded the 1st prize for six Triandrus hybrids with choice flowers. Mr. CHAPMAN also had the best half-dozen poeticus varieties in Distich, Rother, Acme, Fandango and two unnamed varieties. 2nd, Mr. W. B. CRANFIELD.

In a class for six varieties, in which the perianth was restricted to a diameter of three inches, the 1st prize was awarded to the REV. T. BUNCOMBE.

SINGLE BLOOMS.

There was a spirited competition in these classes. *Yellow Trumpet.*—1st, Dr. LOWER, with K. 64, a very refined flower of great substance and richness; 2nd, Mr. F. H. CHAPMAN, with 3K. 10. *White Trumpet:* 1st, Dr. LOWER, with White Knight. *Bicolor Trumpet:* 1st, Mr. C. L. ADAMS, with a superb bloom of Rosemoran Giant; 2nd, Dr. LOWER, with 473. *Yellow Incomparabilis:* 1st, Mr. W. B. CRANFIELD, with a dainty flower of Solleret. *Bicolor Incomparabilis:* Mr. F. H. CHAPMAN, with a refined Bernardino; 2nd, Mr. W. WELCHMAN, with No. 41. *Barrii:* 1st, Mr. W. B. CRANFIELD, with Culverin; 2nd, Miss ISOBEL WORSLEY, with an unnamed seedling. *Bicolor Barrii:* 1st, Dr. LOWER, with an exquisite bloom of Almagra; 2nd, Mr. W. WELCHMAN, with No. 42. *Leedsii:* 1st, Mr. W. B. CRANFIELD, with a delightful specimen of Miss E. M. Bowling; 2nd, Dr. LOWER, with 752. *Leedsii, Division 4B:* 1st, Mr. W. F. COPELAND, with Morning Star: 2nd, THE DONARD NURSERY CO., Newcastle, Co. Down, with White Lady. *Triandrus hybrid:* 1st, Mr. W. F. COPELAND, with an unnamed seedling. *Cyclamineus hybrid:* 1st, Mr. F. H. CHAPMAN, with an unnamed seedling. *Jonquilla hybrid:* 1st, Dr. LOWER, with Gold Mohur. *Tazetta or Tazetta hybrid:* 1st, Mr. F. H. CHAPMAN, with Couplet. *True Poeticus:* 1st, THE DONARD NURSERY CO., with an admirable flower of Ringdove. *Double Daffodil:* 1st, THE DONARD NURSERY CO., with Golden Rose.

SEEDLINGS AND NEW VARIETIES.

All the Daffodils shown in the following six classes were of the exhibitors' own raising. Competition for the Bourne Challenge Cup was very keen, six good exhibits being placed before the judges. The schedule required 12 varieties, and the 72 vases made an imposing display. Two exhibits stood out above the rest—those from Miss ISABEL WORSLEY, Clifton, Bristol, and Mr. F. H. CHAPMAN, Rye. The premier award went to Miss WORSLEY, whose flowers of Peter, Bernardino, Ernest, Giantess, Hope and 7 unnamed seedlings were of great excellence. The outstanding varieties in Mr. CHAPMAN'S exhibit were Mrs. Herbert Smith, Torso, Fandango, Signal, and several unnamed seedlings.

In a class for six varieties not in commerce,

FIG. 108.—NARCISSUS MARY COPELAND.
(See awards, p. 222.)

the 1st prize was won by Dr. LOWER, with Almagra, a lovely bicolor, Barrii, and five unnamed varieties. 2nd, REV. JOSEPH JACOB.

Three entries were made in the Bantam class reserved for six varieties, no perianth to exceed 3 ins. in diameter. 1st, MR. W. F. COPELAND; 2nd, MR. J. MALLENDER.

In a class for three varieties open only to exhibitors who have never won a first prize for seedlings, MR. W. F. MITCHELL, Leck Wootton, was successful with a dainty set. 2nd, MRS. RIDLEY, Wincanton. 3rd, MR. H. F. HOLMES, Derby. Mr. W. F. Mitchell also excelled in the class for three varieties, in which the perianths did not exceed 3 ins. in diameter. 2nd, DR. LOWER. 3rd, MR. H. F. HOLMES.

The Cartwright Challenge Cup was offered for 12 varieties that have not been in commerce more than four years. The only exhibit placed before the judges came from Mr. William Welchman, Wisbech, whose flowers of Mystery, Lord Lister, Dreamland, Clodia, and Patriot were of superior excellence.

The 1st prize in a class for 6 varieties that have not been in commerce more than four years, was won by DR. LOWER with unnamed seedlings. 2nd, MR. C. L. ADAMS with All Trumpet varieties; 3rd, REV. JOSEPH JACOB. For 3 varieties similar conditions to the last named, Miss POPE was placed 1st; 2nd, CAPTAIN J. S. PARKER, Bristol; 3rd, MR. J. H. PADLEY. The Walter Ware Challenge Cup, offered for 9 varieties of Triandrus Hybrids, was awarded to MR. W. F. COPELAND; 2nd, MR. F. H. CHAPMAN.

There were 9 splendid entries in the class for 6 varieties of White Trumpet Daffodils that have not been in commerce more than 4 years. The Challenge Trophy offered as 1st prize was well won by MR. GUY L. WILSON, Broughshane, whose flowers were remarkable for their good form, size, substance, and purity. With the exception of White Emperor, all the varieties were shown under number. 2nd, MISS ISABEL WORSLEY; 3rd, DR. LOWER.

AMATEURS' CLASSES.

A companion class to, but smaller than, the principal one in the open section was for 30 varieties, and a local exhibitor—Mr. W. F. MITCHELL, of Leek Wootton—won the 1st prize with a beautifully arranged collection in which the under-mentioned varieties were of outstanding merit: Seagull, Albatros, Coeur de Lion, Bernardino, Frostbound, Aspasia, Queen of Spain, White Slave, Lucifer, Lord Roberts, Homer and Whitewell. 2nd: Mr. H. R. DARLINGTON, Potters Bar, who had very good blooms, but the staging was less effective than the first-named.

CANON FOWLER, Reading, won the 1st prize for six Trumpet Daffodils, which included pleasing specimens of Treasure Trove, Cleopatra and Weardale Perfection. 2nd, Mr. HERBERT SMITH, King's Heath.

Mr. W. F. COPELAND, who had been awarded the 1st prize in this class for a magnificent collection, was disqualified as the exhibit was not in accordance with the requirements of the schedule.

For 3 Incomparabilis varieties the last-named exhibitor led, followed by CANON FOWLER and Mr. HERBERT SMITH, who were bracketed equal 2nd. In a companion class to the last-named, but with flowers having white perianths, Mrs. RIDLEY was awarded the 1st prize with lovely blooms of Pedestal, Bernardino and Centurian. 2nd, Mrs. BUTLER; 3rd, CANON FOWLER. The best 3 varieties of Barrii blooms were shown by the last-named exhibition; 2nd, Mr. H. R. DARLINGTON. In a similar class to the last-named, but with flowers possessing whitish perianths, Mr. RIDLEY excelled with Ruby, Mascotte and Red Beacon; 2nd, CANON FOWLER.

In a class for 3 Leedsii varieties, Mr. COPELAND led, followed by Mrs. BUTLER and Mr. H. R. DARLINGTON.

For 3 varieties of Leedsii 4B, Mr. W. F. COPELAND was placed 1st with exquisite blooms of Silver Spangle, Morning Star and an unnamed variety. The 3 best double Daffodils were also shown by Mr. Copeland, Mr. W. F. MITCHELL being a good 2nd. Mr. H. R. DARLINGTON showed the best 3 varieties of Tazetta Daffodils as well as the leading 3 Poeticus varieties. Mrs. BUTLER excelled in a class for varieties in which the perianths did not exceed 3 inches in diameter.

Robert Sydenham, Ltd., offered prizes for 12 varieties of Daffodils, which were awarded as follow:—1st, Mr. R. H. DARLINGTON, 2nd, Mr. HAROLD LEE, Wolverhampton.

Messrs. Cartwright and Goodwin's prizes were for 6 varieties of Daffodils. There were 7 good exhibits. 1st, Mrs. RIDLEY; 2nd, Mrs. BUTLER; 3rd, Mr. H. R. DARLINGTON.

The Birmingham Botanical and Horticultural Society's medals were awarded as follows:—Classes 2 to 30 *Silver Medal* won by Mr. F. H. CHAPMAN with 89 points; *Bronze Medal* by Mr. W. B. CRANFIELD with 68 points. Classes 16 to 30 and 31 to 41 won by Dr. LOWER with 74 points; *Bronze Medal* by Mr. F. H. CHAPMAN with 55 points. Classes 16 to 30 and 42 to 55 *Silver Medal* by Mr. H. R. DARLINGTON with 83 points; *Bronze Medal* by Mr. W. F. COPELAND with 53 points.

Messrs. Stuart Low & Co., Jarvisbrook, Sussex, were awarded a Silver Flora Medal for an excellent and varied group, in which were noted specially good hybrid Cattleyas, Odontoglossums and Odontiodas, the yellow Dendrobium densiflorum and the showy scarlet Sophronitis grandiflora.

Messrs. J. & A. McBean, Cooksbridge, were awarded a Silver Banksian Medal for a group of good Odontoglossums and other hybrids, the pure white Laelio-Cattleya Eunice alba Purity; the white Odontoglossum crispum xanthotes, and the very interesting Odontoglossum Eugenia (cordatum × crispum) being specially interesting, the last being recommended for a certificate of appreciation to the raiser.

Pantia Ralli, Esq., Ashtead Park, Surrey (orchid grower Mr. Farnes), sent Odontoglossum crispum aureum Holdenii. of good shape and clear light yellow colour.

C. J. Lucas, Esq., Warnham Court, Horsham, showed Brasso-Cattleya Digbyano-Mendelii var. Evie, a fine white flower tinged with pale lilac.

Messrs. Flory & Black, Slough, showed Odontoglossum Pyramus Langley variety (Louise × l'Empereur), of rich violet colour, with slight white markings.

Messrs. Sanders, St. Albans, showed the white Laelio-Cattleya Frederick Boyle var. Kerchoveae, the scarlet Odontioda William Thompson, and Oda. Diana, the profusely spotted Odontoglossum Elfrida (ardentissimum × Uro-Skinneri), and the quaint Cirrhopetalum picturatum.

Narcissus and Tulip Committee.

Present: Messrs. E. A. Bowles (in the chair), W. B. Cranfield, F. H. Chapman, F. Barchard, H. V. Warrender, Peter R. Barr, W. F. M. Copeland, G. Reuthe, Miss Willmott, Rev. J. Jacob, and C. H. Curtis (Hon. Sec.).

Award of Merit.

Narcissus Prince Fushima.—A large and showy Daffodil, upright and long-stemmed. It is a bicolor incomparabilis variety with a cream-white perianth and a deep and broad crown, finely frilled and of a vivid Indian red colour, with paler shading below and right to the orange-yellow base. The award was made to this variety for cutting and market purposes. Shown by Mr. W. Welchman, Upwell, Wisbech.

Groups.

Notwithstanding the severity of the weather and difficulties of transport, Messrs. R. H. Bath, Ltd., provided a large exhibit of Darwin Tulips in pots. These were staged on the floor-level down the centre of the hall. There were nearly 100 pots, with a few vases of Tulips and Daffodils between them. Among the Tulips the examples of Francis Darwin, Van Poortvleet, Feu Brilliant, St. Simon, Sierrod von Flora, Wm. Copeland, La Tristesse, and Wally Moes, were excellent (Silver-gilt Banksian Medal). The same firm exhibited a group of cut Daffodils, in which Will Scarlet, Coeur de Lion, Phyllida, White Knight, Croesus, the deep golden Buttercup, and the double Inglescombe figured conspicuously (Silver Banksian Medal).

Mr. W. Welchmann, Upwell, Wisbech, showed a small but beautiful collection of cut Daffodils, the flowers clean and large; Boadicea, Illustrious, Hereward, Mystery, Dazzling Beauty, and Lord Lister were capitally shown (Silver-gilt Banksian Medal). Messrs. Herbert Chapman, Ltd., in their group of Daffodils, showed a large number of Poeticus varieties. In addition to many new and unnamed seedlings, this section was represented by Socrates, Fandango, Distich, and Lenore (Silver-gilt Banksian Medal).

A very fine lot of cut Daffodils was exhibited by Messrs. Barr and Sons, and the blooms were surprisingly clean and bright considering the weather experienced. Among the Poeticus forms, Horace, Edna, Timon, Caedmon, and Minerva were represented. Such brilliant crowned forms as Dosoris, St. George, Radiant, Queen of Dawn, Ruby, Cardinal Wolsey, and Jasper were shown, while among trumpet varieties we noted Cleopatra, Earl Goodwin, Tamora, Herod, Prince Arthur, Weardale Perfection, King Alfred, and Michael (Silver-gilt Flora Medal). Mr. W. F. M. Copeland, Shirley, Southampton, also exhibited Daffodils.

Fruit and Vegetable Committee.

Present: Messrs. C. G. A. Nix (Chairman), Jos. Cheal, Owen Thomas, A. Bullock, Ed. Harris, E. A. Bunyard, G. Reynolds, A. W. Metcalfe, G. P. Berry, W. Wilks, W. H. Divers, and G. F. Tinley.

There was no business before this committee, but the chairman and members congratulated Mr. E. A. Bunyard on his return after a long and severe illness.

Fig. 107.—Narcissus Miss Bowling.
(See awards by the Midland Daffodil Society, p. 222.)

MIDLAND DAFFODIL.

April 23, 24.—After an interregnum of two years, the nineteenth show of the Midland Daffodil Society, held at the Edgbaston Botanical Gardens on the above dates, was less extensive than on some previous occasions; nevertheless it was quite satisfactory and exceeded all expectations, and when the exceptionally unfavourable season, together with the great difficulty of transport, are taken into consideration, the Committee has every reason to feel satisfied with the result of the show. Most of the exhibition hall, corridor and annex were filled with exhibits of Daffodils. Seedlings—always a feature at Birmingham—were extensively shown and of surprisingly good quality. Owing to the recent cold weather and frosty nights, Poeticus varieties were rather weak, but few people were prepared to see such a greatly increased number and improved quality of white Trumpet varieties—a section that has been encouraged at Birmingham for several years. On the present occasion the White Daffodil Trophy, offered by two amateur members of the Society, was well won by a maiden exhibitor, Mr. Guy L. Wilson, Broughshane, Co. Antrim, who is to be congratulated, not only in beating eight contestants in this important class, but for the dozen magnificent Trumpet varieties staged in another class, as well as for a number of choice seedlings shown as a non-competitive exhibit. It is to be hoped that Mr. Wilson will become an annual exhibitor at Birmingham. Local or Midland growers were few in number, but passing reference may be made to Mr. W. F. Mitchell, who won the 1st prize with a splendid collection of thirty varieties in the principal class for amateurs.

On the evening of the first day of the show a few exhibitors and friends met at the Grand Hotel, Birmingham, where an impromptu chat on Daffodils took place, and the discussion elicited many very interesting points and much useful information. We regret to learn that while Mr. J. Coey, head of the Donard Nursery Co., Newcastle, Co. Antrim, was en route to the show, he had the misfortune to dislocate his shoulder.

Open Classes.

The leading class was for fifty varieties, representing the different types of the Daffodil. One vase containing three stems of each variety was required. Each of the three contestants, viz., Mr. W. B. Cranfield, Enfield Chase, Rev. T. Buncombe, Black Torrington, and Mr. A. Robinson, Doncaster, showed flowers of first quality, and the prizes were awarded in the order named. The premier collection included superb examples of the new Giant Leedsii Miss E. M. Bowling (see Fig. 107); Falchion, a beautiful flower of great substance and purity; Helmet, Whitewell, Ingoldsby, Elsie Gott, Grenadier, Sybil Foster, Vestal Virgin, Red Beacon, Anthea, Pedestal, Breastplate, Tammerlane, Potent, Lord Kitchener, Crœsus, Melpomene and Dosoris. Mr. Buncombe's best flowers were Dosoris, Jack Russell, White Frank, Moniter, Penguin, Victory, Steadfast, The Angelus, Naomi and Elvira.

Twelve varieties of Trumpet Daffodils.—The exhibit of Mr. Guy L. Wilson (see fig. 106) was of outstanding merit and worthily won the 1st prize. His varieties included White Emperor, Cleopatra, Herod, King Alfred and unnamed seedlings. Miss Pope, King's Norton, who was placed 2nd, showed clean, well-formed flowers of King's Norton, Surprise, Middleton

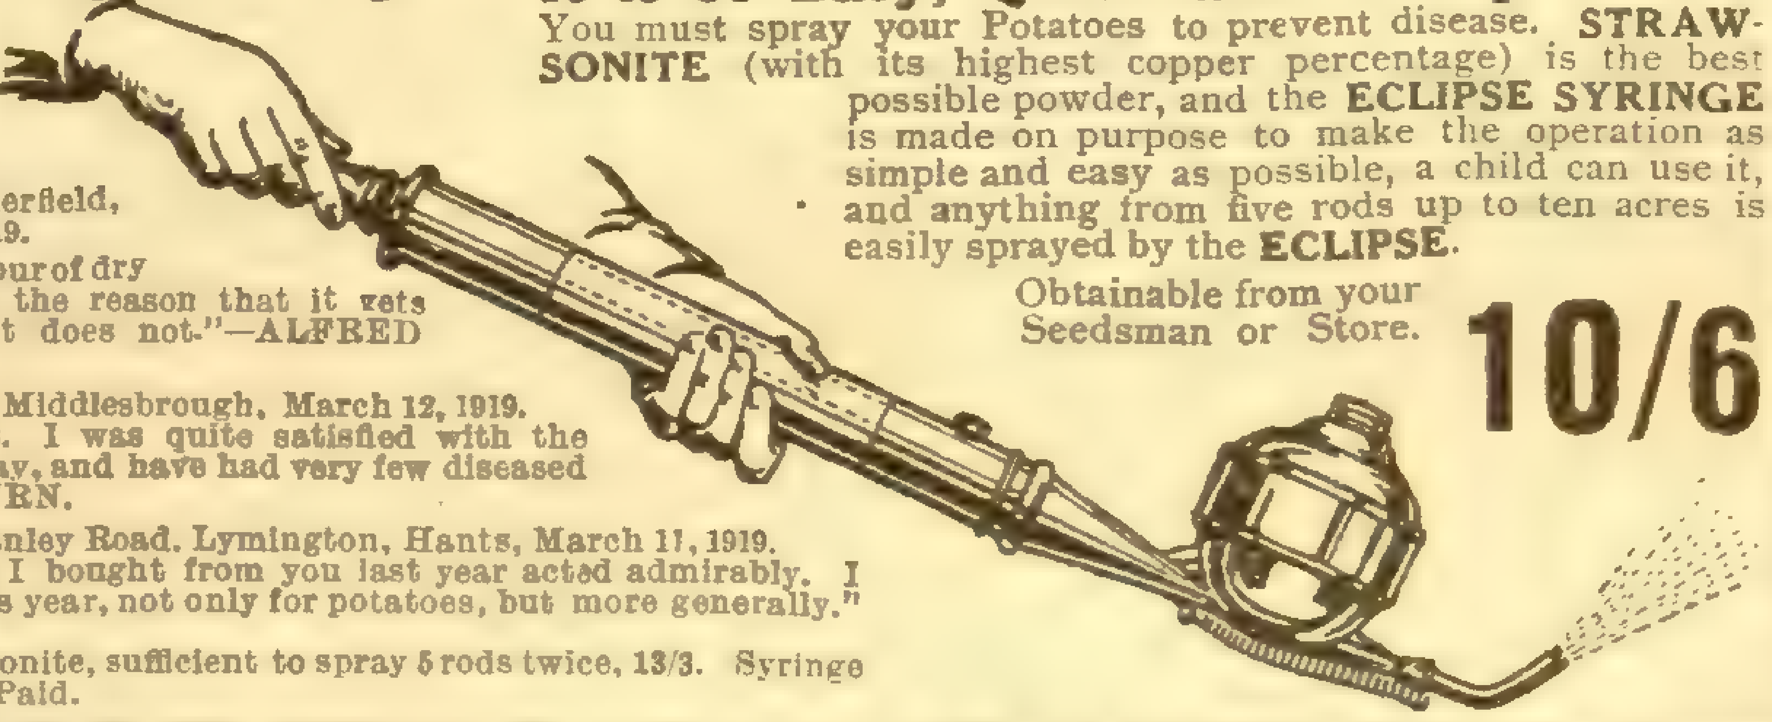
Dry Spray your Potatoes, ONIONS, CARROTS, ROSES, ETC.

It is so Easy, Quick and Cheap.

You must spray your Potatoes to prevent disease. **STRAWSONITE** (with its highest copper percentage) is the best possible powder, and the **ECLIPSE SYRINGE** is made on purpose to make the operation as simple and easy as possible, a child can use it, and anything from five rods up to ten acres is easily sprayed by the **ECLIPSE**.

Obtainable from your Seedsman or Store. **10/6**



WHAT SATISFIED USERS SAY.

Gables Farm. Rotherfield, Sussex, March 12, 1919.
"I am entirely in favour of dry spraying, chiefly for the reason that it gets down where the wet does not."—ALFRED HICKS.

151, Linthorpe Road, Middlesbrough, March 12, 1919.
"Re Spray Outfits. I was quite satisfied with the usefulness of the Spray, and have had very few diseased potatoes."—R. L. BURN.

Vectis View, Stanley Road, Lymington, Hants, March 11, 1919.
"The Spray which I bought from you last year acted admirably. I shall use it again this year, not only for potatoes, but more generally." WM. TUCK.

With 2lbs. of Strawsonite, sufficient to spray 5 rods twice, 13/3. Syringe only 10/6. Carriage Paid.

E. R. BUGGE, Eclipse Works, 102L, Westcombe Hill, London, S.E.3, and 187-188, Hertford Rd, Enfield Wash, Mddex.

AWARDS.

First-Class Certificate.

Double Daffodil Mary Copeland (see Fig. 108).—A shapely flower of medium size, with broad cream-coloured petals and a conspicuous rich orange-coloured centre. Exhibited by Mr. W. F. Copeland.

Awards of Merit.

Double Daffodil Milk and Honey.—Flowers pale cream, with a yellow centre. Exhibited by Mr. W. F. Copeland.

Narcissus Jeanette.—A pleasing pale sulphur yellow, Leedsii variety with a cup of deeper tone. Exhibited by Mr. W. F. Copeland.

Narcissus Boadicea (for Show).—A variety having broad pale cream perianth, deepening towards the base of the tube. Exhibited by Mr. William Welchman.

Narcissus Lady Mayoress (for Show).—A delicate cream coloured Barrii variety. Exhibited by Mr. F. H. Chapman.

Narcissus Miss E. M. Bowling (see Fig. 107).—A beautiful Leedsii variety with a pale cream perianth, the frilled cup suffused with fawn pink. Exhibited by Mr. W. B. Cranfield.

Honorary Exhibits.

Messrs. Barr and Sons, Covent Garden, occupied the west-end of the Exhibition Hall with a grand bank of Daffodils, in which there was a good number of new and rare varieties, together with many of the older favourites. (Gold Medal.) The Donard Nursery Co., Newcastle, Co. Down, also had an extensive display of excellently grown Daffodils. (Gold Medal.) Messrs. J. R. Pearson and Sons, Lowdham, Notts, sent an extensive collection of Daffodils. (Silver Medal.) Mr. Guy L. Wilson, Broughshane, Co. Antrim, had an interesting collection of unnamed seedling Daffodils. (Silver Medal.) Mr. W. F. Copeland, Southampton, also showed a collection of seedling Daffodils. (Silver Medal.) Messrs. Edward Webb and Sons, Stourbridge, showed Cinerarias in great variety, together with Schizanthus and Hipperstrums (Silver Medal.)

NATIONAL ROSE.

April 29.—The society's spring show was held at the London Scottish Drill Hall in conjunction with the R.H.S. meeting. There was a very good attendance of the Rose Society's Members who, as usual were chiefly interested in the new Roses, though the splendid displays of the trade exhibitors received their due meed of admiration. In fact these large contributions of fine fresh blooms contributed largely to the success of the show. There were three new seedlings and one Gold Medal and one Card of Commendation were awarded.

Gold Medal.

Rose Victory.—A brilliant H.T. bloom, fragrant, of perfect form and borne on long stout stalks. The habit of the plant is very good and the foliage is that shining and rich green which rarely becomes affected with mildew. The blooms are of a rich velvety crimson when first open and this slowly becomes rose tinted. It is recommended for all purposes and may be properly described as being a greatly improved Richmond. Shown by Messrs. McGredy and Sons.

Card of Commendation.

R. G. Casson.—A showy H.T. variety recommended for garden decoration and exhibition purposes. It is very fragrant and of striking colouring, which may be described as rose overlying rich gold. The habit and foliage are both ideal. The blooms have a suggestion of coarseness, otherwise it would possibly have received a higher award. Shown by Messrs. B. R. Cant and Sons.

Groups of Roses.

These were particularly attractive, and contained large numbers of the best varieties. Mr. Elisha Hicks has a charming central feature of the fragrant delicately tinted Mrs. Elisha Hicks, which was flanked by smaller, though still large, stands of Mrs. Geo. Norwood, another fragrant variety, the brilliant Madame Edouard Herriot, Chas. E. Shea and Joanna Bridge, with many smaller vases of equally delightful varieties in the foreground. (Silver-gilt medal.)

Messrs. B. R. Cant and Sons gave especial prominence to their novelties Covent Garden, a deep crimson, which received the Society's gold medal last May: Golden Ophelia, a gold medal bloom of the following July; and Emily Gray, a beautiful golden climbing Rose. Besides these, Sallie, Madame Edouard Herriot, Snow Queen, Mildred and many others were especially good. (Silver-gilt medal.) Mr. Geo. Prince had a good background of yellow Banksia Rose, with many standard varieties in front. (Silver medal.)

Mr. E. J. Holland had a small, but especially good, amateur collection of blooms, and was rewarded with a gold medal. One of the best stands in the show was the superb dozen blooms of Marechal Niel, by Mr. A. T. Goodwin, which attracted a deal of enviable admiration.

Decorative Classes.

The various bowls of Roses were scarcely so good as in former years, but still there was much to admire. Silver-gilt medals were awarded to Mrs. Hicks for a fine bowl of Madame Herriot; Mrs. Charleton, for Lady Hillingdon; and silver medals to Mr. Courtenay Page for two different bowls, the best containing Melody, and Mrs. Oakley Fisher for a bowl of Chas. E. Shea.

NATIONAL AURICULA AND PRIMULA.

(Southern Section.)

April 24.—The annual show of the above society, which was held in conjunction with the R.H.S. meeting, was a comparatively small affair. The arrangements were rather of an inconsequent nature; there was no indication of the division, objects or requirements of the different classes, and in one instance there was no clue to the identity of the first prize winner. Mr. J. L. Gibson, Belmont, Surrey, was the chief and most successful exhibitor. He won first prizes with (a) six Auriculas, (b) twelve Alpine Auriculas, (c) six Alpine Auriculas, (d) six fancy Auriculas, and the Premier Card for "Shirley Hibberd," the best show Auricula. His Show varieties include good examples of Shirley Hibberd, the Monk and Harrison Weir. Of his Alpines, Argus, St. Vincent, Prime Minister and a maroon seedling were very fine.

Mr. J. T. Bennett-Poe, Holmwood, Cheshunt, won first prizes for (a) six Alpine Auriculas, (b) four Alpine Auriculas and (c) with Argus I. Auricula, and was second in the class for six Show Auriculas, and with Phyllis Douglas, the Premier Card for the best Alpine. Mrs. Groves, Brondesbury, won the first prize in Class 18, which is for six Alpine Auricula.

Mr. G. W. Miller scored his usual successes with Polyanthuses and Primroses. He was first in all the classes, and also for best group of Auriculas and Primulas. His double Primroses and Polyanthuses were particularly noteworthy.

First-class Certificates.

Auricula Strombola.—This gold-centre alpine was probably the best of its type in the show. The blooms are quite round, flat, large and of intense colour. The combination of the broad gold centre and crimson-maroon is very fascinating. Shown by Mr. J. L. Gibson.

Polyanthus Wallflower. — A single-flowered bunch Primrose The dark Wallflower - red ground colour in delicately yet profusely feathered with gold. The individual flowers are slightly pendulous.

P. Queen Mary.—The general habit of this single-flowered variety would have pleased the old-time florist; it is so regular. But it also possesses great garden value. The whole habit is sturdy, the flower stalk exceptionally stout, and the large blooms are freely produced. The deep yellow flowers have regular orange-coloured rays at the base of the corolla.

Primrose Lord Peckover.—A double-flowered lilac Primrose of uncommon lilac colouring which is brightened by golden blotches at the base. It seems to be free-flowering. All these were shown by Mr. J. W. Miller.

The James Douglas Memorial Cup and Medal were awarded to Mr. J. L. Gibson.

ANSWERS TO CORRESPONDENTS.

Euphorbia amygdaloides: *S. W.* This is a common native plant found in woods and copses from Northumberland and Yorkshire southward. It is a perennial, growing up to one foot in height, with entire leaves 2-3 in. long. We cannot find it offered in any nurserymen's catalogue, but it is almost certain to be found wild near where you live. Your best plan would be to consult some local botanist, who would show you where it grows.

Finnochio: *F. W. C.* Finnochio is a vegetable used largely in some parts of Italy, particularly in the Naples district, but it is somewhat rarely grown in this country. There is no difficulty, however, in producing it: but as it quickly runs to flower and seed, several small sowings should be made rather than one large one. Make the first sowing in April, another towards the end of May, and another in summer. Sow in drills 15 or 18 inches apart, and thin the seedlings to 9 inches apart. An abundance of water should be given in dry weather, and about ten days or a fortnight before Finnochio is to be used, draw some fine soil about the base of each plant so as to block the basal portion. The edible part of Finnochio (Foeniculum dulce) is composed of the broad, thickened leaf bases, which overlap each other and produce a bulbous enlargement varying in size from a hen's egg to a tennis ball. Once this swollen base has developed, and the weather is dry or hot, the plants commence to flower, therefore they should be watched, and used before the flower stem elongates.

Formalin: *J. P.* At the present time formalin is a restricted chemical, and cannot be obtained for soil sterilisation purposes. Messrs W. Voss and Co., Ltd., Carlton Works, Millwall, London, E., supply it in quantity, and it is usually kept in stock by chemists. When purchasing be sure to obtain what is known as 40 per cent. With regard to a pig's ring, this should be procurable from any ironmonger who caters for the general needs of the farmer.

Hippeastrum brachyandrum: *H. R. D.* Hippeastrum brachyandrum is a species introduced from Brazil about 30 years ago. The flower ranges in colour from pale pink to dark red, and has narrow sepals and petals. It is not to be compared to the hybrid Hippeastrums now in cultivation. It should be grown in moderate heat, and not allowed to die down altogether in winter, like the hybrids, but treated more like H. aulicum or H. reticulatum, so that the foliage may gradually die away.

Microscope for Gardener's Use: *V. B.* We advise you to communicate with Messrs W. Watson and Sons, Ltd., 313, High Holborn, London, W.C., or Messrs. C. Baker and Co., 244, High Holborn, London, W.C. Both these firms issue catalogues of second-hand instruments, and you should be able to get a reliable second-hand microscope for about £7. Messrs. Watson and Sons manufacture "The Fram" Microscope, which we recommend for your purpose. You should obtain an inch and 1-6 inch objectives, and you would then be in a position to study most diseases and pests of cultivated plants.

Mite or Rust on Ferns: *H. L. B.* The rusty appearance of the fronds is due to the presence of a microscopic species of mite, which is capable of doing much harm among ferns and is a pest which spreads rapidly. Dipping the plants in, or syringing them with tobacco water at intervals, will eventually make a clearance of the pests, but every part of the frondage must be wetted with the insecticide.

MARKETS.

COVENT GARDEN, April 30.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Plants in Pots, &c.: Average Wholesale Prices.

(All 48's, per doz. except where otherwise stated.)

REMARKS.—White flowers, such as are required for the makng of wreaths and other florists' designs, continue to be a very short supply, Azalea is almost finished for the season and there is only a very limited quantity of white Pelargonium, which will remain in good demand until double white Stock is ready. A few bunches of Stocks are being sent by home growers, and also a few boxes from Guernsey. The best varieties of Daffodils on sale are Emperor, Barrii, Sir Watkin and Grand Monarque. There is a good supply of Carnations. Also Roses of the sorts mentioned in the price list above. These flowers are arriving in excellent condition and their prices are the lowest offered this season. Spanish Irises are now obtainable in white, blue and mauve colours, also Lilium candidum, Gladiolus, Peach Blossom, Sweet Peas, Ixias, Gypsophila, and a few boxes of Narcissus Poeticus.

Lettuce Cabbage and Cos per doz.	2 0– 3 0		
Mint, per doz. bun.	4 0– 6 0		

REMARKS.—The new crop of home-grown Grapes is becoming available and already good bunches of Black Hamburgh and Muscat of Alexandria are offered for sale. Figs from the Worthing district and Melons are amongst the choice fruits on sale and there are also good Peaches from Belgium. Pears, Winter Nelis and Doyenné du Comice from Cape Colony are a little easier in price, the latter variety being the more valuable. Supplies of forced Strawberries are increasing daily and the same is true of English Tomatos and Cucumbers. There are fair quantities of Vegetable Marrows on sale whilst both English and Continental Asparagus is moderately plentiful. New season Carrots and Parsnips find a ready sale. Peas have dropped a little in value, but prices for Beans are well maintained. Owing to the increased quantities Sea Kale is a little easier. The consignments of all out-door vegetables are very limited.

GARDENING APPOINTMENTS.

Mr. John Hay, junr. (at present holding a commission in the R.G.A.), previously for 3½ years Gardener to the late Capt. W. D. DRURY-LOWE, D.S.O., Locko Park, Derby, as Gardener to the Duke and Duchess of NORTHUMBERLAND, at Alnwick Castle, in succession to the late Mr. W. THOMSON. (Thanks for 2s. 6d. for R.G.O.F. box.—EDS.)

Mr. G. H. Payne, as Gardener to the Secondary Schools for Girls, St. George's Avenue, Northampton.

Mr. John Anderson, now demobilised, formerly General Foreman at Curraghmore, Co. Waterford, as Gardener to the Marquis of BREADALBANE, Taymouth Castle, Perthshire.

Mr. G. A. Funnell, who served in the R.G.A. on the Forth Defences, and in France, formerly Gardener at Rufford Abbey, and recently at Lanwades Hall, Suffolk, as Gardener to Capt. GUY NEVILL, and Mrs. NEVILL, Brambletye, East Grinstead, Sussex.

DO YOU GROW FERNS?

If so, you will be interested in an excellent little book on the subject, entitled

FERNS AND FERN CULTURE

written in the first instance by Mr. J. Birkenhead, and thoroughly revised by Mr. F. Parsons.

The printing and illustrations are excellent, and the book is beautifully bound in pale green cloth, with a loose paper cover.

THE

HORTICULTURAL DIRECTORY & YEAR BOOK FOR 1919.

The new edition of the Gardeners' Chronicle Horticultural Directory is now being distributed. Owing to the shortage of paper an unlimited number of copies cannot be guaranteed, and purchasers are advised to ORDER AT ONCE to avoid disappointment.

Orders will be dealt with in strict rotation.

The New Edition has been thoroughly revised and brought up to date. Very many changes of address have been notified during the past year, and holders of the 1918 edition are warned that that edition is now out of date.

Apply, enclosing 2/- for each copy required, to:—

THE CELEBRATED XL ALL SPECIALITIES. BEEN ON TOP FOR 25 YEARS AND STILL THERE!—XL ALL CAUSTIC WINTER WASH (in powder). 1-lb. tin makes 8 to 12 gallons. It thoroughly cleanses Fruit Trees and Bushes, both buds and bark. Can be used any time before the buds begin to swell in the spring. XL ALL NICOTINE LIQUID INSECTICIDE. The gardeners' favourite Wash for the absolute destruction of Thrip, Scale, Mealy Bug, &c. If this wash is used occasionally, a total absence of insects, both on Fruit Trees and Plants, can be secured in any garden. XL ALL NICOTINE SHREDS. The most potent, safe and effectual Fumigant. Used without any apparatus; simply burn on the floor of the Greenhouse. XL NICOTINE FUMIGATING COMPOUND. Both in liquid and cake, these old favourites are still as popular as ever. Many other XL ALL Preparations are indispensable in the garden. Get a complete list from your N.S. or Florist, or send to me for one and name address of your nearest Agent.—G. H. RICHARDS, Manufacturer, 234, Borough High Street, London, S.E.1.

GISHURST COMPOUND has over half a century's reputation for effectiveness in preventing and destroying Red Spider, Scale, Mealy Bug, Thrip, American Blight, Green and Brown Fly, &c. Sold in boxes about 1lb., 3lb., and 12lb., by Dealers in Garden Sundries. Wholesale: PRICE'S PATENT CANDLE CO., LTD., Battersea, London, S.W.11.

NOW IS THE TIME TO PLANT.
KELWAY'S LOVELY GLADIOLI FOR AUTUMN FLOWERS.

KELWAY'S FAMOUS GLADIOLI, planted now, produce grand spikes of glorious flowers from August until late Autumn. They are particularly useful for Church decoration during Harvest Festivals, for large Halls and Hospitals, and for decorating the Home when other flowers are scarce.

Extract from a letter from the Rev. ——, —— Rectory, Swanton Abbot, Norwich:—

11-4-19.

"Dear Sirs,—I had a quantity of Gladioli of you a few years ago, and on 2 or 3 occasions in fact—and they have done remarkably well, and have been of great use for cutting for church decoration. The last 3 or 4 years I have required practically nothing else from about the middle of July to October."

They will grow in towns, and we can supply them in all colours for planting now. Do not buy Dutch bulbs but send at once for our special Price List of named sorts to the Retail Plant Department, KELWAY & SON, the Royal Horticulturists, Langport, Somerset.

GENUINE OLD YORK STONE PAVING for Rustic Gardens, Rose Walks, Terraces, etc.; rectangular and irregular as required.—H. BROOK, Quarry Owner, 40, Valley Road, Streatham, S.W.

DAHLIA STAKES, painted green, tarred ends, 4 ft. 40s., 4½ ft. 42s. 6d., 5ft. 45s., 6 ft. 55s. per gross, carriage paid dozen lots. Speciality pruning knives. — A. YOUNG, 27, Western Elms, Reading.

Make the most of Your Garden in 1919

THE MARKET FRUIT GARDEN.

THE Blackthorn winter came with a vengeance this year, being marked by a blizzard on April 27 and 28. Quite a lot of snow fell, and it remained on the ground for several hours, which, needless to state, is a very unusual occurrence at so late a date in this southern district (Sussex). A similar blizzard was experienced in 1911, but that was quite early in the month. Fortunately fruit bloom is late this year. Only the earliest-blooming Plums—Black Diamond and Monarch—were in full blossom at the time; but several others had some of their bloom expanded and the setting of these flowers will be awaited with anxiety. Naturally it was very much knocked about by the strong wind, but no actual injury to important organs could be detected. Fortunately the temperature was not particularly low at the time, no more than 1 deg. of frost being recorded whilst the blizzard raged. Apple and Pear bloom was still in the cluster stage, and presumably safe, though the surrounding foliage was torn, and now has a scorched appearance. Probably the early Plum bloom was in more danger on the night of the 25th, when 4 deg. of frost were registered; but it is quite likely that the thermometer did not register this low figure for more than a few minutes. So far as can be seen, the bloom of Black and Red Currants and Gooseberries was not injured by frost or snow, but the tops of early Potatos were discoloured.

April was a cold month almost throughout, frost being experienced on twelve occasions. The rainfall also was above the average, 2.92 ins. falling on 13 days at my station. There were very few "growing days," which was no doubt fortunate, in view of the severe conditions to which vegetation was exposed at the close of the month. At the time of writing the weather has become more seasonable, and a warm rain is falling. It is to be hoped, therefore, that the greater part of the fruit blossom will open in conditions that are favourable to pollination.

Late Bloom and Insect Pests.

This is a late season, but not so backward as 1917, which was exceptional. In that year there were no fruit trees of any sort in full bloom before the early part of May. This year the blossoms of the earliest Plums were fully open on April 19, and of Cherries on April 30; but no Pears or Apples expanded a single blossom up to the end of the month. This is a hopeful sign, as late blooming favours a big crop. Insect pests also are late in putting in an appearance. Apple suckers were first seen on April 20, and these were numerous by the end of the month, by which time many young caterpillars of the Winter Moth group were to be found. Probably there are many more caterpillars yet to be hatched, but at present they are far fewer than in the past two years of severe caterpillar plagues. Not an aphis was to be seen up to the last day of April, when a solitary specimen was discovered on an Apple tree, after examining hundreds of bloom clusters. This, however, is not very unusual; and the aphis attack may develop rapidly when the weather becomes warmer. Probably it is too much to hope that these pests have been killed by severe weather, although I know that newly-hatched aphides do succumb fairly easily to frost if exposed on the outside of the buds. After the blizzard I spent several hours examining the trees in the hope of finding that insect pests had been killed by the snow, which was driven into the bloom clusters. I did find a few caterpillars and Apple suckers which had perished presumably from this cause, whilst others looked decidedly sluggish; but the majority were alive and well. If they can stand such an ordeal they will surely survive anything in the way of weather to which they are likely to be exposed.

Cost of Spraying.

Spraying had not been started by the end of April, none of the Apple bloom clusters having reached quite the right stage. It is of little use to spray whilst the buds are short-stalked and cling together so that the insect pests can be found only by forcing the buds apart with the fingers. It is best to wait until the buds have separated, so that the wash can get down amongst the pedicels. It is impossible to catch all varieties at just the right stage where there is much ground to be got over; but I would leave some until after the petals have fallen, rather than waste time and material by spraying during a stage at which it is practically impossible to reach the insects. In some years aphides may be found on the outside of the buds some time before the cluster stage is reached, and then it is worth while to spray early for these alone; but such cases are exceptional. Although I believe that it pays to do plenty of spraying, materials are now so dear that there is no temptation to do work that is of doubtful utility. At present prices of chemicals, the cost of some of the usual washes, per 100 gallons, works out as follows:—

	s.	d.
Caustic soda (20 lb. per 100 gals.)	12	6
Lime-sulphur (winter strength)	10	0
ditto (summer strength)	5	0
Arsenate of lead (4lb. per 100 gals.)	6	0
Nicotine (8oz. per 100 gals.)	7	6
Soft soap (8lb. per 100 gals.)	5	0

I find that to drench a mature Apple tree of average size, as one would with a winter wash or an aphis wash, requires rather more than a gallon of fluid. Where the trees are planted 12 feet apart each way, and are practically meeting overhead, the amount of wash required is about 400 gallons per acre (302 trees). When using arsenate of lead or lime-sulphur at summer strength, with which much lighter spraying, through a fine nozzle, is desirable, I assume that 200 gallons would suffice for an acre, though I have yet to work this out exactly in practice. On the basis of these figures the cost of spraying an acre of fruit trees this year, giving the minimum number of applications likely to be required, is about as follows:—

		£	s.	d.
Winter spraying with caustic soda:	400 gallons	2	10	0
Spraying for aphis, etc., before the blooms open, with soft soap and nicotine:	400 gallons	2	10	0
Spraying for caterpillars and fungus diseases with arsenate of lead and lime-sulphur (summer strength) after fall of bloom:	200 gallons	1	2	0
Second spraying with lime-sulphur for diseases:	200 gallons	0	10	0
		£6	12	0

Labour, fuel for power sprayer, and horse work for carting water would bring the cost up to £10 per acre at least; and with hand sprayers it would certainly be more. Some varieties of Apples do not require spraying for fungous diseases, but against this must be put extra sprayings for aphides and caterpillars, which are always required for some varieties.

Prevention of Aphis Attacks.

Spraying against Apple aphides in spring, particularly the most destructive species, the Rosy or Leaf-curling Aphis (A. malifoliae), is so often unsatisfactory that growers would give much to find a preventive of attack. In the *Journal* of the Board of Agriculture for April, Professor F. V. Theobald suggests spraying in autumn after the fruit has been gathered. It is generally known that the Rosy aphis leaves Apple trees for some other host plant during the latter part of the summer, but returns for egg-laying in the autumn, at which season this species of aphis also is depositing its eggs on the trees. After various experiments carried out during the last fifteen years, Professor Theobald concludes that spraying in October appears to be the most satisfactory method of control. The egg-laying forms of the three usual species of Apple aphis, which are found in the trees in autumn, do not at that season curl up the leaves, but are fully exposed and easily killed if the trees are thoroughly sprayed. Moreover, as risk of scorching the leaves is of little account so late in the year, paraffin emulsion can be employed, which is more potent and normally cheaper than the washes commonly used in spring. The suggestion, coming from such an authority, is worth trying, particularly for young trees, which are often seriously stunted and distorted by Aphis malifoliae (formerly named A. sorbi).—*Market Grower.*

(To be continued.)

NOTICES OF BOOKS.

SCHOOL AND HOME GARDENING.

The title of this book* is rather misleading, for it is almost entirely devoted to school gardening, and only deals with home gardening in so far as the instruction given in school encourages the young to garden at home.

To those who have to do with school gardens the book will provide an interesting account of the work as carried out in America, and some chapters such as "Exercises with Soil," "Lessons with Trees," and the chapter on beautifying the school buildings and grounds contain useful suggestions.

It is not, however, a book to put in the hands of a beginner, for in some matters our friends across the Atlantic would seem to be behind us in their ideas, *e.g.*, the planning of a school garden. Again, neither the methods nor the standard of cultivation are applicable to this country, for, apart from the different crops grown, the plough is substituted for the spade, and the operation of trenching is not referred to in the book. Moreover, there are statements such as the following:—"Young fruit trees should be fed abundantly with fertilisers rich in nitrogen," and on the same page, "phosphoric acid produces stem and root growth," whilst "potash . . . causes the early formation of fruit."

The book is well printed, profusely illustrated, and provided with a good index.

* "School and Home Gardening," by Kary Cadmus Davis, Ph.D., Pp. 353; figs. 160; J. B. Lippincott Company, Philadelphia and London; Price 4s. 6d. net.

THE ALPINE GARDEN.

THE GRECIAN VIOLET.

THE popularity of the Grecian Viola gracilis (see Fig. 109) has been unchallenged since the plant was given an Award of Merit by the Royal Horticultural Society in 1908. For planting big slopes in the rock garden and for making an intense violet carpet in open spaces, beds and flower borders, this wonderful little perennial Viola is of the utmost value. Some of the Aubrietias are more vivid when massed, but Viola gracilis has a deep, rich tone, which is glorious for massing and contracting. Its culture is of the simplest. A deep soil, preferably on a slope between cool, outcropping rocks, plenty of sunlight and an open situation are the main essentials of successful cultivation.

Animals and chemical manures seem quite unnecessary aids to successful culture. In heavy loam or clay soils (where this Viola seems quite at home), it is a good plan to incorporate an occasional dressing of leaf-mould, sand and old mortar rubble, which not only renders the soil more adaptable to the Viola's needs, but also more workable.

In hot situations V. gracilis is often burnt to the ground level during the heat of summer, but with the advent of rain and cooler conditions a fresh crop of green growth is soon produced, which makes low hillocks of foliage for the winter months and assures a great display of blossoms as soon as the spring days arrive.

It was stated at the introduction of V. gracilis that it did not produce seed, but this was soon proved quite erroneous. It is advisable, however, to raise new stocks so far as is possible from cuttings, as seedlings are apt to be a little variable at times. The number of fine Violas which can claim V. gracilis as one parent is very considerable, and many striking subjects for the rock garden are to be found among them. The hybrids, however, need more space than I have at my disposal in this article, so I will confine myself to some of the varieties of V. gracilis.

The first to appear was V. g. grandiflora, true to type in colour, habit, foliage, and height, but larger in all its parts and with flowers almost round, the "butterfly" form having vanished. Lord Nelson appeared at a somewhat later date, but there is a brighter and more purple tone in it, which makes for a warmer effect in the sunlight than V. g. grandiflora produces. The habit of Lord Nelson is, however, somewhat more diffuse and spreading. The first distinct colour variation was Marjorie, a tiny, pale, primrose-coloured gem, which is slightly smaller than V. gracilis itself, but a charming little plant. Golden Fleece is similar to the last-named, save that it is a brighter yellow and a good contrast to the type. Aurea is butter-yellow and a favourite wherever grown, but as yet somewhat rare in gardens. Rarer still are the miniature Golden Realm and Golden Gracilis; the latter is the richest in colour, but it has none too vigorous a habit. V. gracilis minuta, which was in the hands of Messrs. Bunyard a few seasons back, is an exceptionally tiny form, which, as I remember it, had flowers of an opal-mauve shade, and no larger than an ordinary Violet; I do not know whether this plant was perpetuated, but it was certainly an interesting subject. Exquisite, a tiny pale blue form, appeared some time ago, but was too frail to flourish over a long period. Blue Jacket, however, fared much better and found its way into many gardens. It is a lovely Viola, the colouring is grand, and it is far more effective than V. gracilis itself.

Viola gracilis alba is very beautiful and floriferous. It has vreamy-white flowers, but so far as I am aware, it has not yet been placed in commerce, war conditions preventing its appearance at an earlier date. Inspiration is a charming, long-stemmed variety, with blossoms of a pronounced lavender tone and a bright golden eye, which makes it quite a distinct contrast to the tiny, white-eyed V. gracilis.

Violas should always be extensively planted in sunny rock gardens, and the varieties and hybrids of Viola gracilis are certainly the most beautiful and effective forms to plant. *P. S. Hayward, Clacton.*

FIG. 109.—VIOLA GRACILIS: FLOWERS DEEP VIOLET.

SAXIFRAGA LILACINA.

REPRESENTATIVES of the Himalayan species of the genus Saxifraga in cultivation are few in number, and consist chiefly of members of the large leaved or Megasea section. This region is the home of many fine species yet to be introduced. Saxifraga lilacina (see Fig. 110) is a totally distinct type of plant, one that forms dense, cushion-like tufts of crusted foliage similar in habit to the well-known European S. caesia, but not so white, while the flowers remind one of those of S. oppositifolia. This combination of encrusted foliage and rose-coloured flowers is uncommon, the European species with this kind of leaf having mostly white or yellow flowers, exceptions being S. media and S. Grisebachii, which have small red flowers.

Seeds of S. lilacina were collected at a high elevation in Hazara, Western Himalaya in 1899, and received at Kew in the spring of 1900 from the Government Botanic Garden, Saharunpur. A few germinated, and the seedlings formed small tufts which first flowered in March, 1904. The seeds were received under the name of S. ramulosa, a yellow flowered species, and S. lilacina does indeed bear some resemblance in habit to that species, but differs from it in having rosy-lilac flowers. The leaves are densely packed on short stems; they are short and fleshy, concave on the upper side, with 2-4 chalk pits on the margin near the apex. The rosy-lilac flowers are borne singly on stems one inch long, these stems being glandular and furnished with two or three small leaves.

The plant is quite hardy in this country, and grows well under moraine treatment, in which the roots receive plenty of moisture. It is also an excellent pot plant for the alpine house, flowering early in March. The plant illustrated received an Award of Merit at the meeting of the Royal Horticultural Society on March 25, when shown by Messrs. R. Tucker and Sons, Oxford.

THE BULB GARDEN.

HERMODACTYLUS TUBEROSUS.

WHEN Curtis described this plant as "a species of Iris, readily distinguished from every other by its quadrangular leaves" (see p. 206), Iris reticulata had not yet been introduced into cultivation from the Caucasus. When they first appear the leaves of these two plants are indeed almost indistinguishable, but when fully grown it will be found that the leaves of Hermodactylus taper slightly from the base upwards, while those of Iris reticulata are of the same diameter throughout.

Another point of similarity between these two plants is to be found in the seeds, which, when nearly mature, seem to consist of two spheres packed closely together in a single envelope. One sphere is white, and shrivels away almost to nothing as the seed ripens, while the other is a pale pinkish brown and dries into the light brown seed.

The distinction between a Hermodactylus and an Iris is to be found in the seed-vessel. In Irises this is always divided into three divisions by membraneous walls, but in the Hermodactylus there is no such internal division. In all Irises, so far as I know, the division into three is always complete, except in Iris pumila, where in the ripe capsule the membraneous walls seem to be torn apart at the base, though they remain joined together as usual at the tapering apex.

Hermodactylus tuberosus owes its botanical name to the fact that its rootstock consists of one, two, or three tubers, joined together at one end like so many fingers. Dactylus is the Greek word for a finger, but there is no legend to tell us why the tubers were supposed to represent the fingers of Hermes. The new growths proceed from the tips of these tubers. It is interesting to remember, too, that seedlings first produce tubers so small as to resemble minute bulbs, and it is only as they get older that these tubers become oblong.

Its name of Widow Iris is derived from the name La Vedova, by which it is known in Italy, where it appears from the evidence of herbarium material to be fairly common. Dried specimens of it have also been sent to me recently from Syria, though I believe it is not mentioned in the existing floras of that country. In some parts of Devonshire it has, I believe, become naturalised in the hedges, and it evidently needs a warm climate in which to grow well. Here it is very capricious. Sometimes, if I plant it in a warm corner and if the winter is mild, it flowers freely, but in the open garden neither this year nor last has it given me a single flower. It succeeds best in rich light soil.

The colour of the falls of this plant varies a little. It may be a dense, velvety black, but I have had examples in which it was a dark greenish brown. The flower is honey-scented. *W. R. Dykes, Charterhouse, Godalming.*

soil a good soaking immediately after potting but care must be taken to afford water only when necessary afterwards. Place the plants in a warm frame, and shade them from bright sunshine. Another sowing of Primula sinensis may be made now in well-drained, shallow pans filled with finely-sifted loam, leaf-mould and sand. Soak the compost before sowing, and cover the seed with a very light dusting of soil. Place the seed-pans in a warm house and cover each with a sheet of glass, shaded with paper, until germination takes place.

Hippeastrum (Amaryllis).—All Hippeastrum bulbs which have finished flowering should be encouraged to make as much growth as possible. If a house containing arrangements for providing bottom heat pit is available, plunge the pots to the rim in the hotbed and maintain a mild bottom heat. Failing such conditions grow the plants in a house where daily syringing is practised, such as a Peach house. While growth is vigorous afford liquid manure frequently; but when growth has fully developed, stop feeding, gradually withold water, and fully expose the plants to sunlight.

Campanula pyramidalis.—The Chimney Bellflower is very useful for conservatory decoration, and specimens now coming into flower should not be allowed to become dry at the roots. The regular removal of faded flowers will prolong the flowering period. Seeds may be sown now to provide plants for flowering next year; sow in well-drained pans filled with finely sifted, sandy soil, and soak the soil thoroughly before sowing the seed. Cover the seeds lightly with fine soil, cover the pans with glass and paper, and place them on a shelf in a warm house. After germination has taken place remove the glass covering, and gradually harden the seedlings with a view to finally placing them in a cold frame when potted into small pots.

FRUITS UNDER GLASS.

By W. Messenger, Gardener to Major J. A. Berners, Woolverstone Park Gardens, Ipswich.

Tomatos.—The early batch of Tomato plants will now be fruiting freely, and the roots must not suffer for want of water, but at the same time avoid using much stimulating liquid manure, as this induces a thick, soft, unfruitful growth. All lateral growth should be rubbed out at an early stage, and if the plants have attained the necessary length of stem all further extension should be restricted. Gather the fruits when coloured, and store them in a cool room; continue to pollinate the flowers daily. Keep a sharp look out for white fly and, if noted, take prompt measures to destroy the pest by fumigating the house twice or three times at intervals of three or four days. Air should be freely admitted whenever the weather is favourable.

Early Peaches and Nectarines.—Where the early Peach house is furnished with established trees of the early-ripening varieties of Peach and Nectarine, the fruits will be in an advanced state, and (with the exception of Lord Napier Nectarine, which should be lightly shaded when grown near the glass, as the fruits are apt to scorch from the effects of bright sunshine, especially after a dull period) all should be as fully exposed to the sunlight as possible. The usual method of adjusting the fruits in position by means of wood slips needs to be carefully carried out or the fruits will be disfigured, either by undue pressure or by partially resting on the edge of the wood; the latter should be quite two inches wide. To obtain good size, finish, and flavour, liberal ventilation must be afforded in the later stage of growth, leaving the house open until late in the afternoon on warm, sunny days, and if the weather is mild a little ventilation may be permitted at night. Less atmospheric moisture is needed, but there should be no lack of moisture at the roots. The borders should be carefully examined, as after being damped frequently the surface soil will be moist enough, but deeper down it may be the reverse. When watering, give liquid stimulant in some form or other, preferably soot-water or a suitable artificial stimulant; but, whatever kind is applied, it should be quick acting. Thoroughly cleanse the trees of insect pests before the final stage of ripening is reached. Peaches gathered before they are fully ripe, and stored in a cool room for a few days are better in flavour than those that are permitted to remain upon the trees until they fall.

Successional Trees. — Badly placed weakly growths should be removed. A final thinning of the fruits should be made before stoning commences. If the weather is dull and cold, syringing should be discontinued, as a saturated atmosphere during such periods only encourages the development of weak growth and thin foliage. In sunny, mild weather, plenty of air is required, and the house should be closed sufficiently early in the afternoon to render artificial heat unnecessary until late in the evening. In the late house, thinning of the fruits should be done with care, as it is not advisable to reduce the crop to an average one until it can be seen with certainty which fruits are perfectly set.

THE FLOWER GARDEN.

By H. Markham, Gardener to the Earl of Strafford. Wrotham Park, Barnet, Hertfordshire.

Pansies and Violas. — When propagating Pansies and Violas use the young, flowerless shoots springing up in the centres, dibble them in firm, sandy soil, and keep them well supplied with moisture until roots have formed. In many gardens Violas are planted thinly amongst Roses, where they make a good display during the summer and autumn months.

Box Edging.—Clip and trim all Box edgings and plant new edgings if necessary. Plant thinly, deeply, very firmly, and afford water should the weather prove very dry before the newly planted Box is thoroughly rooted.

Planting.—Although it is still too early to plant out of doors tender plants which have been propagated under glass, there should be no delay in removing many forward subjects to cooler places, such as rough frames, where they can be duly hardened and rendered fit for transferring to their summer quarters by the end of the present month.

Ivy-leaved Pelargoniums.—Zonal and Ivy-leaved Pelargoniums, Verbenas, and several other plants, if sufficiently strong, will be all the better if placed in cold frames, matted over during the night, to gradually harden. This will allow more room for other young plants less forward and more tender, such as Alternantheras, Irisines, and Coleus.

Asters and Stocks.—As soon as Aster and Stock seedlings are large enough, prick them off into shallow boxes, drained and filled with a sweet sandy compost. Water sufficiently to keep the soil moist, stand the boxes under glass and shade the plants in sunny weather till they have made fresh roots. Zinnias should receive similar treatment.

THE KITCHEN GARDEN.

By G. Ellwood, Gardener to W. H. Myers Esq., Swanmore Park, Bishop's Waltham, Hampshire.

Brussels Sprouts.—The early batch of Brussels Sprouts raised in boxes and pricked out in frames has provided good plants, and by this date they should be quite hardened and ready for their final quarters. Select a piece of ground that was trenched and manured early, so that it will now be firm. Scarify the surface, set the plants in lines three feet apart, and allow 30 inches between the plants. Give water at the time of planting, and place cinder ashes around each plant if slugs are troublesome. Sutton's Dwarf Gem, Exhibition and the Wroxton are excellent varieties.

Runner Beans.—During the coming week it should be quite safe to sow the main crop of Runner Beans. Draw drills four inches in depth on ground that has been heavily manured and trenched. Work into the bottom of the drills a slight dusting of superphosphate of lime, place the seeds in double lines one foot apart, cover them with three inches of soil and on this scatter some burnt garden refuse. The rows should not be less than eight feet apart.

Beetroot.—Maincrop Beet may now be sown on ground previously occupied by Celery. Proceed by giving an ample dressing of wood-ash and finely-sifted lime or mortar rubble. Fork this into the surface soil, then level and rake it smooth. Draw drills 1 inch deep and 18 inches apart. Blood-red, Pineapple, and Sutton's Black are excellent varieties for deep soils, and Veitch's Intermediate for shallow soils. To obtain specimen Beet suitable for exhibition, bore holes 3 feet in depth and 18 inches apart; fill them firmly with finely-sifted loam, leaf-soil and road grit in equal parts, and sow three or four seeds in each station.

Salsafy.—Sow seeds in well-pulverised soil in lines 15 inches apart. Scorzonera requires the same treatment. Thin the crops when ready, to 6 inches apart.

French Beans.—Make a sowing to meet the demand and thin the plants to one foot apart in the rows.

New Zealand Spinach.—Select a warm position for a row of this vegetable and sow the seeds an inch deep in well-worked soil.

THE ORCHID HOUSES.

By H. G. Alexander, Orchid Grower to Lt.-Col. Sir G. L. Holford, K.C.V.O., C.I.E., Westonbirt, Gloucestershire.

Oncidium.—There are few more ornamental Orchids than the various Brazilian Oncidiums, and there are certainly no flowering plants more worthy of consideration. The plants are fairly easy to establish, but, being so free-flowering, they become exhausted under artificial conditions, especially where the flower-spikes are allowed to remain on the plants too long. Under these latter conditions it is most difficult to keep the plants in a satisfactory condition more than a few years. The late summer and autumn-flowering kinds, O. varicosum, O. Forbesii, O. crispum, O. tigrinum, O. Gardeneri and O. Mantinii, having rested since flowering last year, are making new growths, and as these will soon push forth young roots from their base any repotting that may be necessary should be given immediate attention. The potting compost should consist of good A1 or Osmunda fibre and Sphagnum-moss in about equal parts, chopped up and mixed well together, and some crushed crocks and charcoal added to it. Good drainage is essential, and only a moderate thickness of material is required, but this should be made moderately firm about the roots of the plants. After potting, water the material well and then allow it to become dry before giving a fresh supply. When the roots are permeating the new compost and the young pseudo-bulbs are forming, a full supply of water must be allowed until the latter are fully developed. These Oncidiums are all accommodated in the cool intermediate house, and I find they succeed best suspended near the roof-glass, and where they may have the benefit of all available light. Light is most essential to their welfare, especially during the late summer and autumn months when they are completing their pseudo-bulbs and pushing up their flower-spikes.

Lycaste.—Lycaste Skinneri and its varieties are now making new growth, and the plants will need more moisture at the roots than hitherto. Lycastes do not need an annual repotting, provided a substantial rooting material is employed, but any plants requiring a shift should be attended to now. L. aromatica, L. cruenta and L. Deppei usually flower at this season, the flower buds and new growths appearing together; these may be potted now, or after the flowering stage, the former course being preferable. All Lycastes should be grown in very well-drained receptacles and the pots should not be over-large. For soil, make use of a similar compost to that advised in a former calendar for Anguloas making it firm about the roots of the plants. In the summer months the Odontoglossum house is warm enough for these Orchids, but in the autumn they are better removed to a slightly warmer position where the temperature does not fall below 50°.

TULIPA TURKESTANICA AND T. BIFLORA.

These two small, early-flowering species of Tulip appear to be seldom grown and yet they are worth a sheltered, sunny corner in the rock garden where their flowers will appear sometimes as early as the middle of February and sometimes not till a month later, when the season is exceptionally severe and backward. Both are interesting for they have branching stems six to eight inches in height and T. turkestanica, at any rate, is capable of bearing as many as ten flowers (see Fig. 111). The flowers are small, but open out widely in the sun to a flat star-shaped form and so produce an effective display.

At first sight the two species seem very similar and hard to distinguish from each other. They both produce two or at most three narrow leaves from 5 to 10 inches in length, and ½ to 1 inch broad, with the edges held erect so as to form a narrow channel. The upper surface is of a greyish green, while the under face is darker and not at all glaucous. The edges of the leaves as well as the stems bear minute hairs, and, if in T. biflora the edges appear to be more usually wavy than T. turkestanica, this character is hardly constant and cannot be relied upon to separate the two species.

The bulbs of the two species are very similar, though the inner side of the coats of T. biflora is perhaps rather more thickly covered with hairs of a more downy or woolly nature than those that line the neck of the bulb of T. turkestanica.

In both species the outer segments of the flower are much narrower than the inner, and are of a greyish green colour with a certain admixture of dull purple which is more conspicuous in T. turkestanica than in T. biflora. The inner segments of both have a coloured ridge running up the centre of their white, outer surface. In T. biflora this ridge is green, but purplish in T. turkestanica. In both species the edges of the lower part of the inner segments are fringed with minute hairs. The inner surface of all the segments is white with a yellow centre and, though in T. turkestanica this yellow colour is a sharply-defined, pointed patch that barely covers the lowest third of the segments, in T. biflora it extends about halfway up the segments and then fades gradually into the white.

Other points of difference are to be found in the stamens. In both the bases are thickly set with hairs, but, whereas in T. biflora the filaments bear scattered hairs all over them, in T. turkestanica there is none on the upper part. In T. biflora the anthers and pollen are a creamy-yellow shade, while in T. turkestanica the anthers are dark red-brown, and the pollen brownish.

The number of flowers produced seems to vary in proportion to the size of the bulb. In T. biflora there may be either one, two, or three flowers, while T. turkestanica produces any number from one to ten. It is even capable of producing one branch and flower from the axil of the lower leaf, though it is more usual for all the flowers to be borne above the upper of the two leaves.

The cultivation of both these Tulips is easy, provided that the bulbs are lifted annually when the foliage withers, and not replanted until as late as possible in November, though they should not be kept out of the ground when once they have shown signs of beginning to grow again. The soil should be light, well drained and rich, and not deficient in lime. *W. R. Dykes, Charterhouse, Godalming.*

ORCHID NOTES AND GLEANINGS.

BRASSO-CATTLEYA FAIR ROSAMOND.

From the Duke of Marlborough's gardens, Blenheim, Woodstock, Mr. J. T. Barker, the Orchid grower, sends a very large and handsome flower of a new cross between Brasso-Cattleya Digbyano-Schröderae and Cattleya Mossiae. The flower, which is eight inches across, has petals two and a half inches wide, both sepals and petals being blush white with a slight lavender shade. In the broad, fringed lip C. Mossiae is clearly indicated by the markings at the base running into the chrome-yellow disc as in C. Mossiae. The lip is white, with a blush tint in front; the fleshy column is pure white. The bloom is very fragrant.

BRASSO-CATTLEYA SPECIOSA.

Brasso-Cattleya speciosa, raised by crossing B.-C. Digbyano-Mendelii Fortuna and a white Cattleya Schröderae, is also sent by Mr. Barker. The influence of C. Mendelii has given expansion and improvement to the white form of Brasso-Cattleya used, but although both of the parents have white flowers, the blush pink of C. Mendelii is again in evidence in the progeny. The lip partakes much of C. Mendelii, the fringing being in this case much reduced. The disc is yellow, and there are faint purple lines at the base.

FIG. 111.—TULIPA TURKESTANICA: INNER SURFACE OF THE SEGMENTS WHITE WITH A YELLOW CENTRE.

The Week's Work.

THE HARDY FRUIT GARDEN.

By JAMES E. HATHAWAY, Gardener to JOHN BRENNAND, Esq., Baldersby Park, Thirsk, Yorkshire.

Disbudding Fruit Trees.—All fruit trees trained to walls are greatly benefited by judicious disbudding, and the size and quality of the fruits are also enhanced thereby. Disbudding may be described as a form of pruning, and it obviates the necessity of much winter pruning. No shoot should be allowed where there is not sufficient room for its leaves to develop and obtain full exposure to light. Remove the shoots when they are just big enough to be gripped between the finger and thumb, and disbud only a few at a time. Young trees should have their leading shoots carefully disbudded as it is at this time the foundation of a shapely tree is laid.

Thinning Peach and Nectarine Fruits.—If the season is at all favourable Peach and Nectarine trees set an abundance of fruits which should be thinned severely. Thinning should commence as soon as the fruits are as large as a good-sized Pea seed, and the work should be performed gradually and at intervals of a few days. Some varieties will perfect more fruits than others, but a great deal depends upon the condition of the trees. A young and vigorous tree will perfect quite a third more fruits than a weakly specimen. Very frequently too many fruits are left on a tree and the overcropping causes exhaustion. Generally speaking, if two fruits are left to a square foot a heavy crop is allowed, and only with small-sized varieties should this number be exceeded. The final thinning should be done when the fruits are about the size of a small Walnut, and the aim should be to leave the best-shaped and best-placed fruits to ripen.

Apricots.—Apricot fruits may be left closer together than those of Peaches and Nectarines; in the case of large varieties two fruits to the square foot will be ample, but with medium-sized varieties from four to six fruits per square foot may be left, provided the trees are healthy and vigorous. Apricot trees must not be over burdened, however, and weak trees should be at all times cropped sparingly. It is a mistake to allow the fruits to remain until well advanced and then remove them all at once, as this causes the trees to put forth an amount of energy they cannot sustain over many years.

PLANTS UNDER GLASS.

By JAMES WHYTOCK, Gardener to the Duke of BUCCLEUCH, Dalkeith Palace, Midlothian.

Poinsettia.—The old Poinsettia plants, after being rested and placed in a warm house, soon give a supply of cuttings, which should be taken off with a heel of old wood, and inserted singly in small pots. Plunge them in a propagating case or under a bell-glass, over bottom heat, and when rooted shift them into larger pots and place on a shelf near the roof glass. Old plants to be prepared for another season's growth should be cut back to two eyes, and placed in heat. As soon as a little growth has been made have the old soil shaken from the roots, and re-pot them in fresh compost.

Cineraria.—Cinerarias of the radiata and stellata sections are the most useful types for decorative purposes, and a sowing of these should be made now for early winter use. Sow the seeds in well-drained pans or boxes filled with finely-sifted, light soil; water the soil before sowing, cover the seeds lightly, and place the pans in a cool greenhouse. Afford shade at all times and always grow Cinerarias in cool conditions.

Primula.—Seedlings of Primula obconica, when ready for their final potting into large pots, should be placed in a compost of good loam, leaf-mould, sharp sand, a little rubble or wood-ash, and some dried cow manure. Give the

in response to the recent appeal of the President, Lord Ernle.

Farina Production.—Before the war all farina used in this country came from Germany, Holland and Japan. Farina is largely used in the textile trades for the making of dextrine, gums, glucose and many other chemical products. The manufacture of it produces various bye-products of value to agriculture, consisting of fertilisers and cattle food. Four large farina mills have been erected at King's Lynn, Boston and Hull, and Monikie in Scotland, which it is estimated will be able to supply the home demand and render this country independent of farina of foreign origin. The King's Lynn mill, at Alexandra Dock, King's Lynn, is already working, and using approximately 2,000 tons of Potatos per week.

Pyrus ioensis flore pleno.—In the beauty of the individual flowers Pyrus ioensis flore pleno (see Fig. 112) is the finest of all the Crabs; they are ordinarily 1½ to 2 inches in diameter and some measure over 2½ inches. As may be seen from the illustration they are double, and the numerous petals are of a delicate, soft shade of rose pink. To the charm of colour is to be added that of a delightful violet-like perfume, so that on the whole this Crab is very attractive. The typical P. ioensis is a small, deciduous tree growing 20 to 30 feet high, with downy branchlets and leaves, the branching rather loose and open. The leaves are narrowly ovate, coarsely toothed, and, on the virgin shoots of the year, 3 to 5 inches long and about two-thirds as wide; on the flowering twigs they are smaller. The flowers develop in clusters of six or seven, the five petals are cupped, but although they have the same colour and fragrance as those of the "double" variety they are much smaller and less striking. The fruit has no great beauty, being almost globular, about 1 inch wide, yellowish brown, with pale dots, the flesh hard and very harsh to the palate; it is, however, fragrant. Pyrus ioensis belongs to a well marked group of three North American Crabs, the other two being P. coronaria and P. angustifolia. In gardens, this double-flowered variety has been called by both the two last names as well as its own, and under them is still offered in catalogues. P. coronaria differs in its leaves being broad at the base, sometimes heart-shaped, those of P. ioensis being wedge-shaped. The true P. angustifolia is well distinguished by its smaller fruits and glabrous or nearly glabrous leaves. P. ioensis has a more western distribution in a wild state. The double-flowered variety was first distributed by Messrs. Bechtel, of Staunton, Illinois, in 1891, and in the United States is known as the "Bechtel Crab." It is the latest to flower of the Crabs, and its blossom does not open until late May and early June, by which time the tree is in full leaf and an object of great beauty.

FIG. 112.—PYRUS IOENSIS FLORE PLENO.

London Gardens Guild.—The London Gardens Guild was formed in 1914 to encourage the cultivation of the hitherto unused front and back gardens in the County of London. It was at first intended to encourage the cultivation of plants other than vegetables, but the urgent need for food production compelled the Guild to take up the vegetable side of gardening. The result of the latter experiment was a complete surprise, for the crops obtained were of high quality. Now that the war is over it is hoped that flower cultivation will be generally adopted, although in gardens which may be especially suitable for the cultivation of vegetables encouragement will still continue to be given in this direction. The work of the Guild is restricted to the County of London, but inquiries have been received from, and advice given to, provincial towns which were anxious to establish similar societies. In the event of serious unemployment, the Guild has in readiness a scheme for the cultivation of the unused front gardens in London, the work of preparation to be performed by the unemployed. This scheme has received the approval of the Local Government Board, and the responsible authorities of the Prince of Wales's Fund. A working committee of the Guild is now in the course of formation, consisting of a representative from each borough in the County of London. Central committees are being formed in every borough. The number of entrants in the competitions for the year showed a big decrease over that for the previous year, but the area covered showed a large increase. The decrease was due chiefly to men being called away by the Military Service Act and to women being too busily engaged on war work. Notwithstanding this, most of the gardens which were newly placed under cultivation in 1917 are still being carried on. The total number of entries for the competition was 403. Walworth with 120, South Lambeth Schools with 50, and Marylebone with 30 contributed the largest numbers of entrants. Eighty lectures have been given by the secretary throughout London, many of which were illustrated by lantern slides. The Settlement House at 61, Penrose Street, Walworth, has been furnished and renovated for use as a hostel. During 1918 it was the scene of a number of gatherings, social and educational, the garden parties in the summer being especially enjoyable. The gardens attached to the Settlement House have been used for the purpose of experimental work. An effort has been made to cultivate plants hitherto rarely seen in the London area. It has been found exceedingly difficult to get many plants to survive the winter, and this applies especially to Alpine and rock plants. Among flowering plants which have been a success are Gladioli, Lilies, Irises, Auriculas, many herbaceous perennials, especially the newer types, and Michaelmas Daisies. Dahlias and hardy Chrysanthemums are also very successful. A notable acquisition is Polygonum Baldschuanicum, sometimes called the Climbing Knot Weed, which flourishes over arches and trees and other supports in Walworth. Hardy fruits, such as Apples, Red and Black Currants and Gooseberries are also being tried, but the unfavourable season last year makes it impossible at present to pass judgment on them.

EDITORIAL NOTICE.

Editors and Publisher. — *Our correspondents would obviate delay in obtaining answers to their communications, and save us much time and trouble, if they would kindly observe the notice printed weekly to the effect that all letters relating to financial matters and to advertisements should be addressed to the* PUBLISHER; *and that all communications intended for publication or referring to the Literary department, and all plants to be named, should be directed to the* EDITORS. *The two departments, Publishing and Editorial, are distinct, and much unnecessary delay and confusion arise when letters are misdirected.*

Letters for Publication, *as well as specimens of plants for naming, should be addressed to the* **EDITORS, 41, Wellington Street, Covent Garden, London.** *Communications should be* WRITTEN ON ONE SIDE ONLY OF THE PAPER, *sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.*

Local News.—*Correspondents will greatly oblige by sending to the Editors early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.*

Special Notice to Correspondents.—*The Editors do not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations unless by special arrangement. The Editors do not hold themselves responsible for any opinions expressed by their correspondents.*

Illustrations.—*The Editors will be glad to receive and to select photographs or drawings suitable for reproduction, of gardens, or of remarkable flowers, trees, etc., but they cannot be responsible for loss or injury.*

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, MAY 12—
United Hort. Ben. and Prov. Soc. Com. meet. Bath Gard. Soc. meet.

TUESDAY, MAY 13—
Roy. Hort. Soc. Coms. meet. Nat. Tulip Soc.'s Combined Show. Lecture by Mr. Vincent Banks at 3 p.m. on "Bottling and Drying Fruits and Vegetables."

SATURDAY, MAY 17—
Brighton Hort. Soc meet.

AVERAGE MEAN TEMPERATURE for the ensuing week deduced from observations during the last fifty years at Greenwich, 52.5°.

ACTUAL TEMPERATURE:—
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London, *Wednesday, May 7*, 10 a.m.: Bar., 30; temp., 51°. Weather—Fine.

The Cultivation of the Potato. Potato growers will find a wealth of information in the supplement* to the *Journal of the Board of Agriculture* devoted to the Cultivation, Composition and Diseases of the Potato. The opening pages of the Supplement – a copy of which should be procured and perused by all gardeners—are devoted to a statement of the value of the Potato as a food crop. It is pointed out that with the exception of the Sugar Beet the Potato stands first among food crops in that it produces more human food per acre than any other crop. The recognition of this fact by Germany enabled that country to continue the war longer than would have otherwise been possible, and it is estimated that during the war the Potato formed from one-third to one-quarter of the diet of the German civilian population. In illustration of the importance attached by Germany to the Potato crop, it is recorded that, before the war, of every 100 acres of cultivated land in Germany 10 were under Potatos, whereas in British cultivated land each 100 acres contained on the average only two acres of Potatos.

The high food production of the Potato may be judged by the following figures of the number of persons who may be supported by the produce of 100 acres:—If the crop is used directly as human food, 100 acres of Potatos support 420 persons. If half is fed to pigs and half used for human food, 100 acres of Potatos support 255 persons, 100 acres of Wheat support 230 persons, 100 acres of Barley support 180 persons, and 100 acres of medium grass, producing beef, support 15 persons. It is, moreover, an interesting fact that recent experiments have shown that the dietetic value of the Potato is greater than was formerly supposed, for although the quantity of nitrogenous food substance which it contains is not great, the nutritive quality of the proteins of the Potato is remarkably high.

The enhanced importance of the Potato during the war led the Food (War) Committee of the Royal Society to undertake an investigation into the composition of British-grown Potatos with respect to which there was but little data available. The analysis of many samples of Potatos showed that there was a certain measure of variation in composition, and that of late varieties Arran Chief and Evergood stood highest in nitrogen content and Up-To-Date lowest. In early varieties Great Scot is ahead of all others. A curious fact is brought out by the analysis of Potatos grown in eastern and western districts of England. In each variety (Arran Chief, King Edward VII., Great Scot and British Queen) the percentage of dry matter is higher and that of nitrogen lower in the eastern-grown than in the western-grown Potato.

So much has been said recently in praise of the Potato that it is as well to remember that there are certain disadvantages attaching to it, *i.e.*, its bulkiness, lack of keeping quality, wastage in clamp and uncertainty owing to disease. As a set-off against these disadvantages, however, are to be mentioned its ease of cultivation, its suitability for growing in newly broken up grass land and for planting near towns where sparrows take too heavy a toll of grain crops, and also its amenability to late planting. After balancing advantage and disadvantage the Supplement concludes that the Potato is the most valuable of all spring crops and a close second to autumn sown Wheat. The place of the Potato in crop rotation is subject to no fixed rule. In the early districts of Ayrshire and Cornwall Potatos are grown in the same land year after year, but are followed by autumn catch crops such as Broccoli, Rape or Italian Rye Grass. In the Fen districts they may be planted every three years, or they may occupy a part of the root "break" and usually follow a Corn crop. Although farmyard manure is generally applied to the Potato crop, nevertheless good yields may be obtained by the use of artificials alone—*e.g.*, 2 cwt. of sulphate of ammonia, 5 cwt. of superphosphate, and 2 cwt. of sulphate of potash.

With respect to varieties, the Supplement mentions favourably May Queen, Duke of York, Ninety-fold, Epicure, Sharp's Express and Eclipse among the first earlies; British Queen (although often very susceptible to blight), Great Scot, King George V. and Royal Kidney among second earlies; King Edward and Evergood as early maincrop varieties; Arran Chief (which though excellent in other respects is very susceptible to wart disease), President (a disease-resistant variety, but susceptible to leaf curl and therefore not to be grown except with annual change of seed), Up-to-Date and similar varieties, Langworthy, Golden Wonder and What's Wanted, Irish Queen, Lochar and Templar among maincrop (late) varieties.

Importance is properly attached to change of seed and to the use of Scotch and Irish seed, and records are given showing the advantage of new seed over once-grown and the yet smaller yield of twice-grown seed. Other subjects dealt with in the part of the Supplement devoted to cultivation are storing and boxing seed, pitting or clamping, planting time, lifting and spraying.

The concluding part of the Supplement is devoted to diseases of Potatos, but a consideration of this important subject must be deferred to a subsequent occasion. Enough has been said to justify the observations made at the commencement of this review that this account of the Potato should be studied by all those interested in its cultivation or use.

* Journal of Board of Agriculture Supplement, No. 18, March, 1919. 6d. post free.

British Carnation Society.—A re-union dinner and concert will be held by the British Carnation Society at the Holborn Restaurant, on Wednesday, May 21, at 6.45 p.m. Mr. J. S. Brunton will preside.

Bradford Chrysanthemum Show Abandoned.—The Bradford and District Chrysanthemum Society, being unable to obtain a suitable hall in which to hold its exhibition, has decided to abandon the show for 1919.

Mr. E. H. Wilson appointed Assistant Director of the Arnold Arboretum.—On April 14th last the Board of Overseers of Harvard College appointed Mr. E. H. Wilson Assistant Director of the Arnold Arboretum, in succession to the late Mr. Charles E. Faxon. Mr. Wilson is eminently fitted to fill this important position, for he has a most extensive and varied knowledge of plants, and as a plant collector in China and other parts of the East has enriched our gardens with a wealth of new flowering plants, trees, and shrubs. Mr. Wilson was formerly engaged in the Botanic Gardens at Edgbaston, under the late Mr. Lathom, and the knowledge of plants he acquired there and subsequently at Kew was of inestimable value to him in his several plant-collecting expeditions. He is the author of several works, dealing mainly with new plants of the Far East, and is a valued contributor to this journal. It is a signal honour for British horticulture that the important post of Assistant Director in this celebrated American botanic garden has been given to an Englishman.

Guide-Lecturer at Kew.—Lord Ernle, President of the Board of Agriculture, replying to a question asked by Lord Sudeley in the House of Commons, said he was strongly of opinion that an official guide ought to form a part of the regular establishment at Kew Gardens. The educational facilities afforded there were great, and advantage should be taken of them in the interests of the public. As soon as the sanction of the Treasury had been received an appointment would be made, and notice of it would be given. It was hoped that the experiment in its new form would be even more successful than in the old, and that the results would be such as to warrant its permanent continuance.

Land Settlement for Ex-Service Men.—According to the Board of Agriculture, 10,250 ex-service men in England and Wales have so far applied through the local authorities for small holdings under the Land Settlement Scheme. About 4,000 civilian applicants are also reported. The ex-service men ask for 188,266 acres, the civilians for 64,273 acres. The total amount of land asked for by ex-service men and civilians is 252,539 acres, and the total number of applicants 14,250. Since December 20 last, County Councils in England and Wales have acquired or agreed to acquire 14,354 acres of land for settlement purposes. The Councils propose to acquire under schemes now being considered by the Board of Agriculture a further 84,932 acres. About 150 landowners have offered approximately 30,000 acres direct to the Board

because employers who think about the matter at all know that it is to their advantage as well as to the advantage of their workers that the latter should be in a union. *An Old Gardener's* contention that "the remuneration does not solely consist of the money paid" does not help things, because very often a dilapidated cottage is used as an excuse for the payment of a dilapidated wage. It will interest *W. M. G.* to know that we have a much better weapon than the strike at our disposal, and if he is a gardener and cares to join the union he can learn what that weapon is. One thing is certain, that gardeners will not obtain improved conditions so long as they are in a state of isolation and cut adrift from the rest of organised workers. If it is in the interest of employers to form a huge association, representing hundreds of millions of pounds' worth of capital, surely it ought to be in the interests of the workers to do likewise. Let me assure *An Old Gardener* and other critics that no official of the British Gardeners' Association is living in luxury on the funds of the union. No one except the General Secretary and staff is in receipt of wages. Branch secretaries, whether loud voiced or otherwise, work for love, and we are grateful to them. *Cyril Harding.*

Cauliflowers and Broccoli.—The list of Cauliflowers and Broccolis enumerated by *John Dunn* on page 199 of *The Gardeners' Chronicle* for April 26th is an interesting one, but appears to be somewhat incomplete, as practically all the French Cauliflowers are omitted, while in Brocolis one fails to find the Cornish and the Angers strains which, as now developed, easily cover the first three months of the year; Perkins' Leamington, an early April variety indispensable alike to the market and private grower; Cattell's Eclipse and Wrench's St. Magnus, the finest Kentish selections of the June type. As regards the French and northern varieties of Cauliflower, All the Year Round, an improved type of the Half-Early Paris, with erect leaves, very large pure white heads of remarkably fine grain, hardy, quick-growing and adapted both for forcing and open-air culture at any time of the year, deserves special mention. A later form of the same variety, slightly larger but in other respects identical, and known by the Paris market gardeners as Triomphe, is equally recommendable. Lenormands, for size, weight and hardness; and Reliance (Le Cerf), for its heat-resisting qualities; and Walcheren, for size, hardiness, and reliability, are too well known to need further description, while a really choice strain of the Early Dwarf Erfurt, the parent of many popular varieties (including the Danish Snowball), is very hard to beat. The Mediterranean varieties omitted include Algiers Giant Early, Eclipse, Maltese Giant, and Metropole, which, with Veitch's Autumn Giant and Late Italian Giant, will keep our tables well supplied with large solid heads of the finest quality and most attractive appearance from August to February, at which time the Cornish and Anjou Broccolis are ready to cut. It is, of course, possible that some of the foregoing may have been included by Mr. Dunn under other names than those mentioned above. The cultural notes in the concluding paragraph of Mr. Dunn's article are extremely valuable. *Seedsman.*

Richmond Park (see p. 166).—So far as I am aware, neither Henry VIII. nor any succeeding monarch found a favourite retreat in Sheen Lodge. Henry VII. built his splendid palace at Richmond, which previous to his time was called Shene, where he spent a great part of his time and he died there. Henry VIII. lived for some time in the Palace, and so also did Queen Elizabeth and King Charles I., who formed the New Park, as it was called then, or Richmond Park, as it is called now. The date of the enclosure is given as 1636. Queen Anne gave a lease of the park for 99 years to the Hydes. King George I., fond of shooting, bought out the terms of the last Earl of Clarendon, and appointed Sir R. Walpole's son Ranger of the Park. The King gave orders for a shooting lodge to be erected for his use in the Park, and this now forms the central portion of the White Lodge. Meantime, the King, being fond of Walpole's punch, used to adjourn with Walpole to his house on the hill at Richmond. The King knew no English, and Walpole spoke no German; hence Morley, in his *Life of Walpole*, says: "There are few more curious pictures of conviviality under difficulties than that of George I. after a morning's hunting at Richmond—drinking punch and talking dog Latin with Walpole all the afternoon." George II. and George III. both hunted in the Park, but they resided at Richmond Lodge and at Kew, so we must rule out Sheen Lodge as being the favourite retreat of any English monarch. At all the carriage entrances to the Park a special plan of the Park, drawn by the Ordnance Survey, is displayed, and the area of the Park, including Petersham Park, is given on that plan as 2,469 acres, which is well over the 2,350 acres mentioned in the note on page 166. *Hugh Findlay.*

Shamrock.—I have pleasure in replying to Mr. Nicholson's query (page 208) as, since landing in the Green Isle, forty years ago, the "Chosen leaf of bard and chief" has been of peculiar interest to me. Then, situated in Kildare, I enlisted the services of a local authority to procure the "True Shamrock" *-magna est veritas* —and this proved to be Trifolium repens, there sworn by as the original plant honoured by St. Patrick. Years after, located in south County Dublin, I found folks swearing at T. repens as an impostor; Dublin would have none of it, but T. minus was the genuine and only "Dear little Shamrock of Ireland." On that conflicting evidence antique lore was sought on the subject, and the following led to the inference expressed in my note (to which Mr. Nicholson refers)—viz., Sir Henry Piers in Vallencey's *Collecteana Rebus Hibernica*, states: "Between May Day and harvest, butter, new cheese curds, and shamrock are the food of the meaner sort." This would apply to the Wood Sorrel, then abounding, when Ireland was covered with woods, as being an agreeable salad herb, which the Trefoils are not. The *Irish Hudibras*, 1689, says of the Irishmen:—

"Shamrogs and watergrass he shows,
Which was both meat and drink and close."

But most conclusive of all, perhaps, is that wherein Fynes Morrison, writing of his countrymen says: "They willingly eate the herbe Shamrock, being of a sharpe taste." The *Irish Hudibras* also states:

"Within a wood near to this place
There grows a bunch of three-leaved grass,
Called by the boglanders Shamrogues,
A present for the Queen of Shogues" (spirits).

This is all the evidence I have at the moment, but, summed up, I cannot but think it pretty clearly points to Oxalis Acetosella, the Wood Sorrel, then abundant, but now rarely met with, so far at least as my observation goes; and the cause which led to its disappearance, viz., the clearing of Ireland's woods and forests, favoured the Trefoils, and consequently the use of the latter as the emblem. *K., Dublin.*

Big Bud Mite (see pp. 141, 156, 183, 209).—I am not surprised that Mr. C. W. Mayhew (p. 209) finds that Boskoop Giant did not long remain immune from this pest. With me it ceased to be resistant several years ago, and is now so badly infested that the last of the bushes will be grubbed next autumn. I am sorry to read that he does not find Seabrook's Black quite immune, as I am planting that sort largely. This year I found only about half-a-dozen big buds on about half an acre of bushes that have been planted three years. I believe that, although not absolutely immune, Seabrook's Black is the best mite-resister available at present. I find Goddard's Monarch very good in this respect, keeping fairly free from mite, though growing close to badly infested Boskoop Giant bushes. *Market Grower.*

Phytophthora Disease of Tomatos (see p. 188).—I was at one time troubled with this disease, but since using fresh loam cut from the turf-heap, mixed with Vaporite at the rate of one forty-eight pot full to each five barrow-loads of soil, and washing the pots with chlorate of lime —one quarter of a pound to eighteen gallons of water—my Tomato plants have been free from the disease. *C. S.*

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

APRIL 8.—*Present:* Messrs. E. A. Bowles (in the chair), W. C. Worsdell, W Hales, J. Fraser, and F. J. Chittenden (hon. sec.).

Hybrid Freesias.—Mr. DALRYMPLE brought a large number of forms of Freesia which his brother, Mr. H. Dalrymple, had raised at Bartley, near Southampton. The range of colour was extraordinary, from yellow and bronze to pink and purple. A Certificate of Appreciation was unanimously recommended to Mr. Dalrymple for work in raising these new Freesias.

A Multiple Flower of Narcissus.—From the same source came a flower of Narcissus Minnie Hume, with double the number of parts normally present.

Bamboos at Gunnersbury and Enfield.—Mr. BOWLES showed specimens to illustrate the manner in which Bamboos had suffered from the weather during the past season, while Mr. HUDSON brought others from Gunnersbury in the best of condition. The climatic conditions in the two localities, though so near, must have been markedly different. Mr. Hudson attaches great importance to planting Bamboos in moist soil, never on high banks.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

APRIL 3.—*Present:* The Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, A. Burns, J. Evans, A. Hanmer, J. Howes, A. J. Keeling, W. Pickup, J. Thrower, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATES.

Odontoglossum crispo-Solum var. Perfection (crispum × c. Solum). and *Odm. Ebony maximum* (Thompsonianum × King Arthur); *Odontioda Illustris var. marginata* (Odm. illustrissimum × Oda. Charlesworthii), and *Oda. albo-rubra* (Odm. Rawdon Beauty × Oda. Chanticleer), and *Oncidioda Cooksoniae superba* (C. Noetzliana × Onc. macranthum), from P. SMITH, Esq.

Odontioda Deliverance (parentage unknown) and *Odm. ardentissimum var. Doris; Odontioda Rajah West Point var.* (Oda. Lambeauianum × Odm. Rio Tinto), and *Cattleya Queen Mary*, from S. GRATRIX, Esq.

AWARDS OF MERIT.

Odontoglossum crispum West Point Ruby, Cattleya Schröderae var. Distinction, and *Lycaste Skinneri Royal Beauty*, from S. GRATRIX, Esq.

AWARD OF APPRECIATION.

Odontoglossum amabile var. Cleopatra (crispo-Harryanum × Franz Masereel), and *Odontioda Brunette* (Odm. Vuylstekeii × Oda Zephyr), from S. GRATRIX, Esq.

GROUPS.

A Silver-gilt Medal was awarded to S. GRATRIX, Esq., Whalley Range (gr. Mr. J. Howes); and a Silver Medal to Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. E. Burns), for collections.

APRIL 17.—*Present:* Rev. J. Crombleholme (in the chair), Messrs. R. Ashworth, W. W. Field, J. Howes, A. Keeling, J. Lupton, D. McLeod, and H. Arthur (secretary).

AWARDS.

FIRST-CLASS CERTIFICATES.

Laelio-Cattleya Moonbeam var. Oriflamme (C. Schröderae × L.-C. G. S. Ball), and *Odontoglossum crispum xanthotes West Point var.*, from S. GRATRIX, Esq.

Odontioda Gladys magnifica (Odm. Pescatorei × Oda. Bradshawiae), and *O. aurea var. Beauty* (luteo-purpureum Vuylstekeii × Charlesworthii), from P. SMITH, Esq.

Horticultural Club.—The Annual Dinner of the Horticultural Club will take place on Tuesday, May 20, at 6.30 p.m., at Anderton's Hotel, Fleet Street, E.C. After dinner there will be a musical programme.

British Gardeners' Association.—The Annual Conference of the British Gardeners' Association will be held at the Imperial Hotel, Birmingham, on Whit Monday, June 9, when a large attendance of delegates is expected. The Union has enrolled over 2,000 members during the past few weeks, and formed many new branches.

Kew Guild Annual Meeting and Dinner.—The annual dinner of the Kew Guild will be held on Wednesday, May 21, at 7.15 p.m., at the Dean Hotel, 83-89, Oxford Street. It will be preceded by the annual general meeting at 6.30. Members who intend to be present at the dinner are asked to notify the Secretary, Mr. A. Osborn, 191, Kew Road, Richmond, Surrey.

Plant-Breeding Institute for Wales.—At the half-yearly meeting of the Governors of the University College, Aberystwyth, it was announced that Mr. Lawrence Phillips, of Llanstephan House, Radnorshire, had offered the College £10,000 for the purpose of founding a plant-breeding institute for Wales in connection with the agricultural department of the College, and guaranteed a further sum of £1,000 a year for ten years towards the maintenance of the institution. It was also reported that Mr. R. G. Stapleton, who was for some years connected with the College in the capacity of advisory botanist, had been appointed to the Chair of Agricultural Botany at the College and director of the plant-breeding institute. Professor Marshall pointed out that this generous and far-sighted gift by Mr. Lawrence Phillips would do much to foster the study of problems connected with grasses and the growth of cereals in Wales, and thereby increase production from the soil.

Retirement of Mr. M. Biggs.—After a period of forty-three years' service as gardener at Garnstone Castle, Weobley, Herefordshire, Mr. M. Biggs is retiring. During this time he was for 24 years gardener to Mr. Reploe, and for 19 years in the service of Sir Joseph Verdin, Bt. Mr. Biggs was at one time foreman at Eastnor Castle, Ledbury, under the late Mr. Coleman. He is succeeded at Garnstone by his only surviving son, Mr. G. M. Biggs.

Gardeners' Royal Benevolent Institution.—As most of our readers are aware, this useful gardening charity has, in the past, derived a considerable portion of its income from its Festival Dinners, but owing to the exigencies of the times, these annual festivals had to be abandoned, and for the past four years the funds of the institution have suffered a very considerable decrease in consequence. Apart from this fact, vast sums of money have been contributed by the charitable to the various war funds, so that the older institutions have seen their annual income fall very considerably below those of pre-war times. Now that peace is again in sight, the Committee has decided to hold the dinner as usual this year, and the Grocers' Company has kindly placed their fine hall in Prince's Street, E.C., at the disposal of the Committee for the holding of the dinner on June 19. The fact that Sir Harry Veitch has consented to preside on this occasion should make the dinner a great success for, apart from the fact that he has been so long and honourably associated with horticulture, gardeners will wish to give him the fullest measure of support, seeing that he is of their profession and has the esteem of everyone both in commercial and private gardening. Sir Harry Veitch has been associated with this worthy gardening institution for many years, and has held the office of Treasurer for not fewer than thirty-three years. There could be no more fitting object for a gardeners' War Memorial than the placing of the funds of this and its sister charity, the Royal Gardeners' Orphan Fund, on a sound basis, as has been suggested by several correspondents in these pages. The Gardeners' Royal Benevolent Institution stands urgently in need of support, and the Committee was only able to recommend the election of fifteen candidates from an approved list of fifty-eight applicants at the last election. At the present time 262 persons are in receipt of annuities for life at an annual cost of nearly £5,000, and others on the waiting list are temporarily assisted from the Victorian Era Fund. We appeal to all interested in gardening to assist the Gardeners' Royal Benevolent Institution. We shall be happy to receive contributions at this office, and trust that our readers will make a liberal response

Inheritance of Characters in the Culinary Pea.—So long ago as 1908 Lock summarised our knowledge of the genetics of the genus Pisum, and since that date much research of considerable interest and value has been published. Students of genetics should therefore be grateful for a summary bringing together the results of recent research into the inheritance of the characters of the genus. Such a summary has been prepared by Mr. O. E. White.* The summary contains some useful references to pre-Mendelian workers—to Knight, for example, who observed but did not explain the phenomenon of the dominance of tallness over dwarfness, and of purple flower colour over white. To Knight also was due—according to Sherwood—the introduction of marrowfat (wrinkled) Peas. The genus Pisum is remarkable in respect to the fertility which obtains between the so-called species. Of species of Pisum the *Index Kewensis* recognises 7, viz., P. arvense, P. elatius, P. formosum, P. fulvum, P. humile, P. Jomardii, and P. sativum. It is doubtful, however, whether they are all true species; for example, P. arvense, P. elatius, and P. Jomardii (Egyptian) are very similar to one another and, moreover, when crossed they yield fertile hybrids. Again, P. arvense and P. sativum are so similar that the former is perhaps to be regarded as a subspecies of the latter. P. formosum is distinguished from these species by its perennial habit and its lack of tendrils, and P. fulvum again is distinct by reason of its rusty, cream-coloured flowers and black-coated seeds. The only known case of sterility between "species" crosses of Pisum concerns P. humile, the Palestine Pea, which, used by Mr. Arthur Sutton in crosses with the culinary Pea (P. sativum) failed in some cases to give seed. Mr. White's summary is fairly complete, but it is curious that he should have failed to give an account of what is the most interesting work done of recent years—that concerning the curious wild-looking "rogues" well known to growers, and the genetics of which has been worked out so ably by Prof. Bateson and his colleagues. In another contribution† by the same author, the number of genetic factors which have been investigated in Pisum is computed to be 35, so that no fewer than 70 characters in this plant have been shown to depend on factors which behave in inheritance in a Mendelian manner.

HOME CORRESPONDENCE.

(The Editors do not hold themselves responsible for the opinions expressed by correspondents.)

Finnochio (p. 222, May 3).—The important sowing of this vegetable should be made in July. When full grown, after earthing up as usual, the plants may be stored under shelter in earth, and are available during much of the winter. *H. E. Durham.*

The National Gladiolus Society.—It was a great surprise to me to learn that the winding-up of the above Society was in contemplation. That the flower is gaining in popularity cannot be doubted, judging from my limited experience. I wrote to two trade growers for some corms a short time back and received in each case a letter of regret stating that all stock was sold or replanted. I hope Mr. Bliss will be successful in creating fresh interest in the Society on the lines he suggests. Your long and interesting report of the Midland Daffodil Society's show at Birmingham clearly proves what can be done with proper co-operation between the trade and the amateur. *A Lover of the Flower.*

Damage by the Blizzard.—The snowstorm on Sunday, April 27, inflicted terrible damage here, in some respects worse than the one in February, for though it did not injure so much the old Oaks and Elms as the one earlier in the year, it punished the shrubs and trees of 20 to 40 years old, which I have planted myself, far more severely. It is curious that Aldenham should have suffered more heavily from the two snowstorms of 1919 and the one of 1918 than it has done during the rest of the last 35 years put together. This has been for us, though not for others, one of the worst winters ever experienced; it is true that the February fall of snow was in some respects a blessing in disguise, for, great as was the damage it inflicted, it more than made up for this by saving the lives of hundreds of shrubs when our thermometer registered 33° of frost. In the case of this last snowfall, however, there is nothing to counterbalance the mischief, which has been greatest among the genera of Pyrus and Crataegus. I will give a few instances out of many plants which have become a total wreck: Crataegus orientalis, planted 70 years ago by my grandmother, and a beautiful lawn specimen; Celtis australis, Pyrus Malus floribunda, Pyrus betulifolia, Euonymus verrucosus. All these trees were from 30 to 40 years old, and were choice examples; now not one of them has an unbroken bough left. The amount of labour that will be involved all over the garden in removing broken branches and pruning is appalling. Though others have not suffered so badly as the trees above named, yet there is hardly one which has escaped scot free. I do not think it is too much to say that three successive winters like that of 1918-9 would practically wipe out my life's work; however, that is not likely to happen, and *Bonne mine à mauvais jeu* is a good saying. *Vicary Gibbs, Aldenham House, Elstree.*

Gardeners' Hours and Wages (see pp. 128, 144, 157, 169, 183 and 196).—Your correspondent, *W. M. G.*, seems to be worried about the possibility of a strike of gardeners. Let me hasten to assure him that we are achieving our aims without resorting to the weapon of the strike. I am very glad to say that we are getting reports from all over the country that employers are adopting our standard of hours and wages, and in some cases are even going beyond it. It is my experience that if the matter is put to employers in the right way, there is very little difficulty in getting what we ask. Our greatest enemies are not employers, but critics of the type of *W. M. G.* I thank *An Old* and *An Old Gardener.* I thank *An Old Gardener* for his letter, which has caused intense amusement among our branches and members generally, and would be taken more seriously if the personal note were left out. Any individual should know that trades unions fix a minimum wage and not a maximum, and the suggestion that all classes of gardeners should receive equal pay does not come from our side. We do not wish to force employers to engage our members. There is no necessity for that,

No. VIII., of the Act of 1842 provides as follows: "The profits arising from lands occupied as nurseries or gardens for the sale of the produce shall be estimated according to the rules contained in Schedule D, and the duty shall be charged at the rate contained in that schedule; and when the said duty shall have been so ascertained the same shall be charged under Schedule B as profits arising from the occupation of lands."

On the other hand, the Act of 1887 provides that any person occupying land for the purpose of husbandry only may elect to be assessed under Schedule D instead of under Schedule B, subject to his giving notice to the surveyor within two calendar months after the commencement of the year of assessment. This involves the question of the meaning of the word "husbandry," which I will refer to later. Your readers will recollect that by the Finance Act, 1918, assessments under Schedule B are to be made on the basis of an amount equal to twice the annual value of the land; provided that if the land is not occupied for the purposes of husbandry only, or mainly for that purpose, this provision is to be limited to an amount equal to the annual value instead of to twice the annual value (unless the Board of Agriculture should certify that the use of the land other than for the purpose of husbandry is unreasonable).

It seems clear, therefore, that whatever may be the practice adopted by surveyors in some localities, nurseries are, strictly speaking, assessable to income-tax under Schedule D (profits), except perhaps in so far as they are devoted to the purposes of husbandry.

Excess Profits Duty.

The question of whether nurseries are liable to pay excess profits duty also turns upon the question of the meaning of the word husbandry. It will be seen later that Mr. Justice Sankey's view is that husbandry might be defined as "tilling the soil and producing from it commodities for human consumption." This raises an interesting question in the case of nurseries which during the war have devoted a portion of the land to the production of food, and it would certainly seem from the expressions used by the learned judge that, where it is possible to separate the purely nursery business from the business of growing food, a grower can claim to be exempted from excess profits duty in respect of that portion of his profits which has arisen from food production. Mr. Justice Sankey was, however, careful to add the following qualification: "I can conceive of cases where two branches of the business of a person or a company are so interlaced that it is impossible to separate them, and, although I express no definite opinion on the point, it may be that in those circumstances if the main branch of the business is subject to excess profits duty the whole business is subject to the duty on the ground of the impossibility of separating the main branch from the rest of the business. There, again, the decision would depend very much on the facts of the case, . . . but it might be more difficult to arrive at a decision where the one business is ancillary and incidental to the other in such a way as to make them nearly inseparable." In this connection certain well-known nurseries naturally come to mind where the greenhouses are devoted to growing or "nursing" on a considerable scale such diverse horticultural produce as Palms, pot flowers, Tomatos, and Grapes. In such establishments it would seem that for a short distance they are devoted to the business of husbandry, but a little further on they are metamorphosed into nurseries, and so on alternately! (Incidentally these establishments involve a further debateable point as to whether they should be described as nurseries or whether they are in fact market gardens. So far, however, as the questions of income-tax and excess profits duty are concerned the well-known cases of Smith *v.* Richmond and of Purser *v.* the Worthing Local Board are of little assistance, as they relate to the wording of quite different Acts of Parliament in connection with rating.)

Definition of Husbandry.

Over 25 years ago the Courts held that husbandry was not confined to ordinary farming, but that it included the cultivation of a market garden. The case recently decided by Mr. Justice Sankey now appears to carry the matter a step further. The facts of this case were set out in the *Gardeners' Chronicle* of April 5th last, and need not be repeated here, but it will be recollected that the action referred to the profits of certain manufacturing chemists, who successfully claimed exemption from excess profits duty in respect of their cultivation of land for the purpose of growing medicinal and other herbs to be treated in their factory. On behalf of the Crown the Attorney-General contended that, in exempting husbandry from excess profits duty, Parliament only intended the word to apply to the ordinary farming class, and he pointed out that the Act of 1887, referred to above, used the word husbandry, but the marginal note to such Act reads "*Farmer* might elect to be charged under Schedule D," and there is a similar marginal note to the Act of 1890. He also contended that in the Income Tax Acts the word husbandry has always been taken to mean ordinary farming, and that Chambers' Dictionary defines husbandman as "a working farmer who labours in tillage" and husbandry as "the business of a farmer, tillage"; while the Oxford English Dictionary states that a husbandman is "a man who tills or cultivates the soil, a farmer," and that husbandry means "tillage or cultivation of the soil (including also the rearing of livestock), agriculture, farming." He further contended that the growing of herbs was merely a subsidiary business to that of the chemical factory in question. On the other hand the Hon. W. Finlay, K.C., contended on behalf of the chemists that husbandry included "everything connected with the growing of crops." In reply, the Attorney-General urged that the chemical manufacturers had substantially only one business, and that an auxiliary branch of that business could not be separated from the rest for Revenue purposes.

In delivering judgment Mr. Justice Sankey expressed the view that it was not very useful to refer to dictionary definitions of husbandry, but he could not support the contention that husbandry meant merely farming. In his opinion husbandry was a term of very wide signification, and he went on to say: "Though I am not prepared to hold that a man who tills and cultivates the soil is in all circumstances a husbandman or a man engaged in husbandry, I can see no distinction between a man who does so in order to produce food for human consumption and a man who does so in order to produce medicines and drugs for human consumption. Beyond that, the question whether a man is engaged in husbandry is very much a question of fact and of degree, and such questions are for the Commissioners. . . . I think that the respondents were engaged in husbandry, i.e., *in tilling the soil and producing from it commodities for human consumption.*"

The remarks of the learned judge in connection with the interlacing of two separate branches of a business might also interest nurserymen who have devoted a portion of their land to food production during recent years. The following extract from the judgment throws considerable light on the point: "I can conceive of cases where the two branches of the business of a person or a company are so interlaced that it is impossible to separate them, and, although I express no definite opinion upon the point, it may be that in those circumstances, if the main branch of the business is subject to excess profits duty, the whole business is subject to the duty on the ground of the impossibility of separating the main branch from the rest of the business. There, again, the decision would depend very much on the facts of the case. The case where an individual carries on two separate businesses, of which one is liable to the duty and the other is not, is a simple one; but it might be more difficult to arrive at a decision where the one business is ancillary and incidental to the other in such a way as to make them nearly inseparable. The same considerations apply in the case of a company as of an individual. . . . If a company were engaged in two separate businesses it might be clearly liable to pay excess profits duty on one business and not on the other. The difficulty only arises where the two businesses converge and one business is ancillary to the other. But the difficulty is largely one of fact, and *where it is possible to separate the businesses there is nothing in law to prevent this from being done*, and in the result one of the businesses may not be subject to duty."

It would appear that the Crown has not taken steps to appeal in this case.

The definition of "husbandry" referred to above raises a further question as to how far it might prove of assistance to seedsmen. For instance, in growing vegetable seed for sale seedsmen are perhaps not strictly growing food for human consumption, but as they are certainly growing the seed for such food, it would seem unreasonable to draw so delicate a distinction to their detriment. In fact, the growing of the seed is clearly a vital part of the process of growing food for human consumption. *H. M. V.*

A company has recently been formed at Calstock, Devon, under the title of "The Tamar Valley Chip Basket Factory, Ltd." The company will acquire large buildings near Calstock Railway Station for the purposes of a chip basket factory, and up-to-date machinery is being installed. The new company will manufacture baskets, boxes, barrels, and other packages used in fruit transportation.

Gardeners employed in the nursery and garden trade in and about the city of Edinburgh resolved, at a meeting held recently, to ask for an increase of wages from 9½d. to 1s. 6d. per hour, with time and half for overtime. It is proposed that the increase should take effect from May 1, and it was decided to send a copy of the resolution to the Edinburgh and District Master Gardeners' and Nurserymen's Association. It was also resolved to form a union of employees, and of those present upwards of 70 were enrolled as members.

CROPS AND STOCK ON THE HOME FARM.

Meadow Hay for Cows.

Cowkeepers, especially those who are butter producers, know the value of high quality meadow hay for improving not only the quantity but also the quality of milk. The smaller, finer grasses, known as "bottom grass," add greatly to the value of the crop in point of quality, and are obtained as a result of the liberal use of farmyard manure, basic slag, superphosphate and sulphate of ammonia. The authorities at the Rothamsted Experimental Station recommend the use of nitrate of ammonia as a spring dressing for crops.

A mistake all too commonly made is that of deferring too long the cutting of the grass for hay, thus allowing the taller and coarser growing grasses to become matured, with a corresponding loss of nutriment to the animals. Meadow hay is also reduced in quality by allowing it to lie too long after being cut, so that it loses the power of becoming sufficiently heated in the rick, which is so important in obtaining high quality.

When meadow grass is cut and the weather is favourable it should be almost kept "in the air" for two days, when it will be ready to be put into a rick. Many people spoil their hay by trying to save labour; they simply cut the grass, allow it to lie in the swathe, pull it together with a horse rake, and cart it. The result is the top side is "sweated" and the under side is yellow.

Potatos.

The planting of main crop Potatos is unusually delayed this season owing to the unfavourable weather, especially on heavy land. No time should be lost in getting the sets planted. If the land has been deeply ploughed it should be further worked by cultivator or scarifier, harrowed and rolled if necessary to obtain a desirable surface. A quick method of planting is to use three ordinary ploughs and

Odontoglossum King George V. (parentage unknown), and *O. crispum Joyce Hanmer* (F. K. Sander × Maud Rochford), from A. HANMER, Esq.

Cattleya Trianae var. Lady Leon, from Sir H. LEON, Bart.

AWARDS OF MERIT.

Laelio-Cattleya Moonbeam, L.-C. Armenica, and *L.-C. Balliae magnifica*; *Odontioda Orphanae* (parentage unknown), and *Cattleya Evelyn Sander magnifica* (Dusseldorfii × Trianae alba), from S. GRATRIX, Esq.

Dendrobium Brouchartii, and *D. nobile var. Sanderae*, from Capt. HORRIDGE.

Brasso-Cattleya Maronii Bridge Hall var., from Mrs. BRUCE and Miss WRIGLEY.

Cymbidium Marshal Foch, from Col. Sir J. RUTHERFORD, Bart.

Odontoglossum crispum Empindale (Rossendale × Empress of India), from P. SMITH, Esq.

Laelio-Cattleya Elinor var. Edith (L. Coronet × C. Schröderae), from Sir H. LEON, Bart.

AWARDS OF APPRECIATION.—FIRST CLASS.

Odontoglossum var. Violet Gem (parentage unknown), from Col. Sir J. RUTHERFORD, Bart.

BOTANICAL CERTIFICATES—FIRST CLASS.

Coelogyne nervosa. *Angraecum Leonis*, and *Promenaea Crawshayana*; from Sir H. LEON, Bart.

Oncidium concolor albens Haddon House var., from P. SMITH, Esq.

CULTURAL CERTIFICATES.

Miss EDITH WATSON (who has had charge of the Orchid section for Sir H. Leon, Bart., during the latter period of the war), for a fine example of *Angraecum Leonis*.

Mr. CONINGSBY, for *Dendrobium nobile* and *D. Cooksoniae*.

Mr. LUPTON, for a *hybrid Cymbidium*.

GROUPS.

A Silver-gilt Medal was awarded to S. GRATRIX, Esq., Whalley Range (gr. Mr. J. Howes); a Large Silver Medal to Mrs. BRUCE and Miss WRIGLEY, Bury (gr. Mr. A. Burns); and Silver Medals to Col. Sir J. RUTHERFORD, Bart., M.P., Blackburn (gr. Mr. J. Lupton), and Capt. HORRIDGE, Bury (gr. Mr. Coningsby), for groups.

Obituary.

Sir Frank Crisp, V.M.H.—British horticulture has sustained a severe loss in the death of Sir Frank Crisp, which occurred on April 29, after an illness lasting for about a fortnight, at Friar Park, Henley-on-Thames. Sir Frank had not enjoyed good health for the past two years, but he had a strong constitution, and the news of his death came as a grievous surprise to his many friends. He was a native of Bungay, Suffolk, where he was born on October 25, 1843, the only child of John Shalders Crisp of that parish. He was educated at University College, London, and chose the profession of a solicitor, eventually becoming a partner in the firm of Messrs. Ashurst, Morris, Crisp and Co., Throgmorton Avenue, E.C. His firm specialised in matters appertaining to Company Law and Sir Frank was regarded as one of the very first solicitors in the City of London and the highest authority on Company Law. He was a member of the Board of Trade Committee, under Lord Davey's chairmanship, which recommended important amendments to the Companies' Acts, and during the war Sir Frank was appointed one of the three Commissioners to inquire into the question of the Army Hut Contracts. Early in his professional career he resided at Henley-on-Thames, and eventually built Friar Park in the midst of some of the most beautiful scenery in the upper reaches of the Thames. The gardens at Friar Park are amongst the most remarkable in the country, and contain features which are to be found in no other place. The rock garden is world famous, and is stamped by an originality of design that makes it an object of great interest to all who see it. The stone of which the rock garden was formed was brought from the Leeds district; no fewer than seven thousand tons were employed and many of the stones weigh each so much as six and a half tons. The rockery is crowned by a representation, built to scale, of the famous peak of the Matterhorn (see *Gard. Chron.*, October 23, 1909, fig. 122). A stream commences at one of the highest points, and winding and twisting, tumbles down until it reaches a little pool at the base. One of the entrances to the famous caves is from the rockery, and in these subterranean passages are "conceits" and surprises in which Sir Frank Crisp took an almost boyish delight; for the garden was made to express the man: his large mindedness, his real love of beautiful effect, and his whimsicality. The series of tiny mediaeval and legendary gardens was unique, being faithful copies of ancient pictures displaying the painstaking spirit of a bygone age. But it must not be imagined that Friar Park includes only surprises and oddities: the gardens, indeed, include many delightful features. The lake, with its banks clothed with beautiful flowers and shrubs, and its small bridges leading through colonies of Water Lilies and other aquatics, is very charming, and so is the Japanese garden with its stone lanterns, stepping stones, and other appurtenances connected with a garden of this style. The shrubberies, flower borders, rosary, herb

THE LATE SIR FRANK CRISP, BART., V.M.H.

garden, Rhododendron dell and beautiful lawns are all excellent features well maintained, and there are numerous glass-houses, some of which are devoted to the cultivation of Orchids. It was Sir Frank Crisp's great delight to welcome all who cared to visit his remarkable gardens and grounds, and the place was open for inspection every week at a nominal charge, the proceeds of which were devoted to the Gardeners' Royal Benevolent Institution, the Royal Gardeners' Orphan Fund and local charities, each of which received a very considerable amount each year from this source. Sir Frank Crisp, although one of the busiest of men, found time to take an active part in the work of botanical and horticultural societies. At the time of his death he was President of the Horticultural Club; from 1881 to 1906, Vice-President and Treasurer of the Linnean Society of London; and from 1878 to 1889, Honorary Secretary of the Royal Microscopical Society. For his work in connection with horticultural science and practice, he was awarded the Victoria Medal of Honour in Horticulture by the Royal Horticultural Society early in the present year. The funeral took place at Henley-on-Thames, on Saturday, the 3rd inst., and it was evident from the aspect of the town that the inhabitants had lost a worthy citizen and one they held in high esteem and honour. The Reverend E. M. Radford officiated at the service in the Parish Church, at which the Mayor and Corporation attended in state. The large building was filled with mourners, including representatives of the many societies and institutions with which Sir Frank was connected. Amongst those present were Mr. Justice Eve, Mr. H. R. Blaker (representing the Law), Sir David Prain (President of the Linnean Society), and Mr. G. F. Tinley (representing *The Gardeners' Chronicle*, and Honorary Secretary of the Horticultural Club).

E. Horne.—We announce with deep regret the death of Mr. E. Horne, late gardener to Rosalind, Countess of Carlisle, at Castle Howard. Mr. Horne died on April 23, aged 55. He was previously for seven years at Graymount, Belfast, six years at Cornhill, Biggar, Lanark, and twelve years at Netherhall, Cumberland. He was a skilful cultivator of Sweet Peas and Chrysanthemums, and won many prizes for these flowers. He leaves a widow, two daughters and one son, Mr. G. Horne, gardener to Mr J. C. White, Craigavid House, Co. Down.

Charles Blick.—We regret to announce the death of Mr. Charles Blick, of Warren Nurseries, Hayes, Kent, which took place on the 30th ult. The deceased appeared to be in his usual good health on Tuesday, April 29, but he had a stroke during the evening and passed away the following day without regaining consciousness. Mr. Blick was famous in horticultural circles as a clever raiser and cultivator of Carnations. For over twenty years he was head gardener to the late Mr. Martin R. Smith, at Warren House, Hayes, and during that period they created a new enthusiasm for border and show Carnations by raising large numbers of handsome and robust varieties of the finest form and colour, to which no fewer than four gold medals and sixteen silver cups were awarded. After the death of Mr. Martin Smith in October, 1908, Mr. Blick commenced business on his own account and formed the Warren Nurseries, where he continued his work as a raiser of Carnations, and during the last three years of his life he also carried out the duties of head gardener to Lady Laidlaw, at Warren House, during the absence of Mr. J. Brown, who was with His Majesty's Forces in Serbia. On the occasion of the investiture of H.R.H. the Prince of Wales at Carnarvon Castle, Mr. Blick had the honour of supplying the bouquets, and H.M. Queen Mary graciously accepted the two baskets of Carnations and named the two new varieties Queen Mary and King George, the former salmon-rose and the latter pure white. One of Mr. Blick's most recent and successful novelties is the pure white Malmaison variety which bears his name. Mr. Blick was 63 years of age, and he leaves a widow, who is almost an invalid, a son and four daughters to mourn his loss. The remains were laid to rest at West Wickham on the 3rd inst.

TRADE NOTES.

Nurseryman, in the issue of April 12, raises some very difficult points with regard to the assessment of nurseries, but the kindly terms in which he invites me to contribute some notes on the subject tempt me to venture upon ground on which one might well hesitate to tread in view of the many Acts of Parliament which bear upon the matter, and the unsatisfactory way in which some of them are worded.

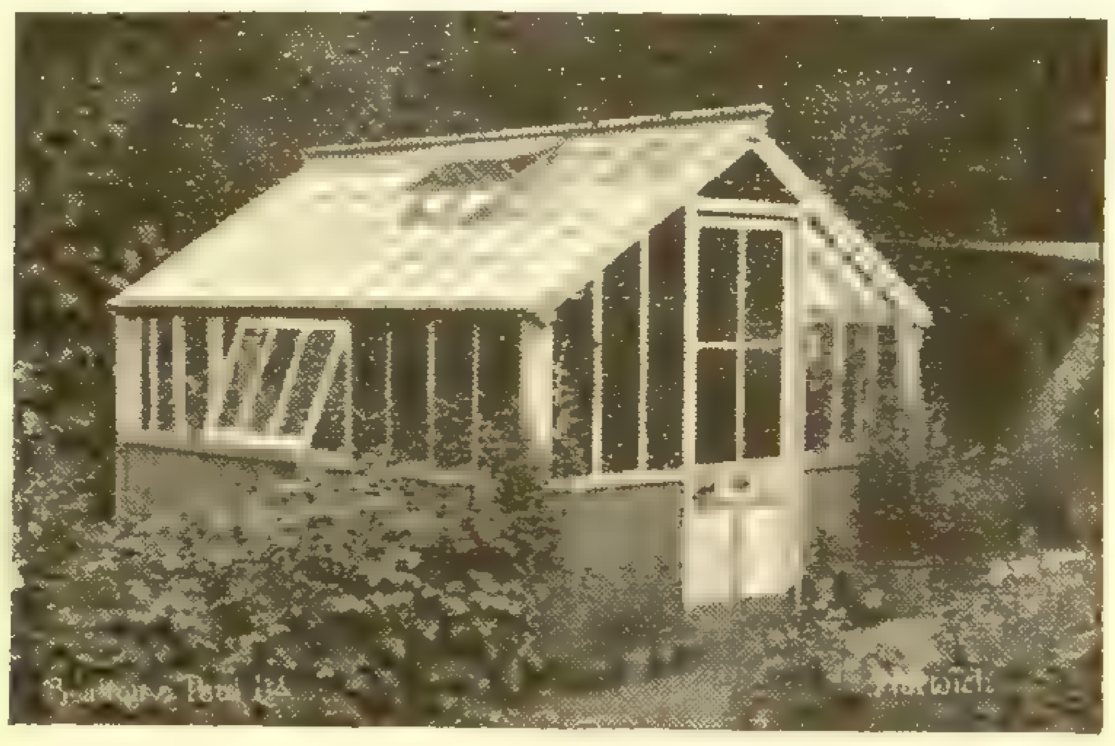
Nurseryman invites me to state my views, principally on three points, namely: (a) The assessment of nurseries for income-tax purposes; (b) the excess profits duty; and (c) the legal definition of the word "husbandry." These three questions raise distinct considerations, and I will endeavour to deal with them in turn, so far as is possible within the limits of an article. The subject, of course, is one the full consideration of which would need an entire volume.

INCOME TAX.

It would be both valuable and interesting if the income-tax recovery agent whom *Nurseryman* mentions would explain his reason for doubting whether nurseries are properly subject to assessment under Schedule D (profits) instead of under Schedule B (occupation of land), as in the case of farmers. Section 63,

Two Fine Things needed by small Gardeners.

These are just two articles which show how this great business considers and meets the needs of all, who, in a large way or a small one, want the best there is at a price they can afford. The same great resources—the finest of skilled workmanship—the best materials—and a century old experience—combine in every case to produce the best available at the lowest possible price.



No. 49a. SMALL GREENHOUSE.

Made in sections ready for easy erection anywhere by anyone. Size 10 ft. × 8 ft.

Price £24 10s.

Thoroughly well made. Painted two coats. Glazed with 15 oz. glass. Other sizes made.

These are in stock—Ready for Immediate Delivery.

Carriage paid to any Station in England and Wales.

SEEDS

THAT FULFIL EXPECTATIONS.

The Gardener who buys TOOGOOD'S GUARANTEED VEGETABLE AND FLOWER SEEDS has a definite reason for doing so.

He knows he can make his own Garden as gay and as profitable as the one he has so often admired.

He comes to Toogood's expecting more than he could hope for from any other seed firm; and the best part of it is that TOOGOOD'S GUARANTEED GARDEN SEEDS will not disappoint this expectation.

They are bred to yield Better Crops of delicious Vegetables and more lovely Flowers; and EVERY packet of seeds ordered from the beneath Guides MUST grow for YOU and please you or you will GET IT REPLACED FREELY.

Free Guides for You.

(1) Toogood's Free Guide to Garden Wisdom and Guaranteed Vegetable Seeds, (2) Toogood's Free Guide to Guaranteed Flower Seeds, and (3) Toogood's Free Guide to Summer Bedding Plants, Dahlias, etc. Postcard of application will do. No obligation. Address us personally:

Seedsmen to H.M. the King, and Growers of "Better Crops" Seeds only,
SOUTHAMPTON.

MARKETS.

COVENT GARDEN, May 7.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general average for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—EDS.

Narcissus ornatus, per doz. bun. ...	2 6– 3 6	Violas, per doz. bun.	4 0– 6 0

REMARKS.—A shortage of white flowers constitutes the same difficulty for florists as last week. Daffodils are now finishing and prices for best blooms have fallen to 6s. and 7s. per dozen bunches. Pheasant's Eye Narciss (Ornatus) is being replaced by Narcissus Poeticus. A few boxes of these latter blooms are arriving from Guernsey and Scilly and a good supply from home growers should be offered in a few days. There is still a satisfactory number of Carnations and Roses and the prices for these flowers are the same as those of last week. A few boxes of Gladiolus Peach blossoms are arriving in excellent condition. Spanish Irises remains a limited supply. Sweet Peas are being offered in white, pink and mauve colours but larger supplies would be welcomed. Gypsophila is the leading line in French flowers just now, although the supplies are very irregular. Enquiries are already being made for double white Narcissus; these blooms will be greatly appreciated by most buyers in spite of the high prices that are likely to be made for the first few consignments. With the exception of Smilax, all foliage is lower in value. As much as 5s. to 8s. per bunch of 6 trails was paid for Smilax this morning, (May 6).

REMARKS.—Supplies of hot-house fruits available include—Black Hamburgh and Muscat, of Alexandria Grapes, Melons, Figs, Peaches and Strawberries. There are also Pears from Cape Colony of the varieties Winter Nelis, Calabash and Doyenné du Comice. Other fruits on sale are Bananas, Oranges, Pineapples, Grapes and Peaches from Belgium. There are fair quantities of both English and Continental-grown Asparagus. Mushrooms are slightly more plentiful, and there is a fair supply of Seakale. The supplies of Rhubarb, Vegetable Marrows, Cucumbers, Peas, Dwarf Beans new Potatos and Tomatos show an increase daily.

DICKSON & ROBINSON, MANCHESTER.
Seed Growers and Seed Merchants,
WARRANT HOLDERS TO H.M. THE KING.

NOW IS THE TIME TO PLANT.
KELWAY'S LOVELY GLADIOLI FOR AUTUMN FLOWERS.

KELWAY'S FAMOUS GLADIOLI, planted now, produce grand spikes of glorious flowers from August until late Autumn. They are particularly useful for Church decoration during Harvest Festivals, for large Halls and Hospitals, and for decorating the Home when other flowers are scarce.

Extract from a letter from the Rev. ——, —— Rectory, Swanton Abbot, Norwich:— 11-4-19.

"Dear Sirs,—I had a quantity of Gladioli of you a few years ago, and on 2 or 3 occasions in fact—and they have done remarkably well, and have been of great use for cutting for church decoration. The last 3 or 4 years I have required practically nothing else from about the middle of July to October."

They will grow in towns, and we can supply them in all colours for planting now. Do not buy Dutch bulbs but send at once for our special Price List of named sorts to the Retail Plant Department, KELWAY & SON, the Royal Horticulturists, Langport, Somerset.

ALPINE and BOG PLANTS, 800 spare varieties, from very large collection, sold cheap; send for list.—REV. ANDERSON, Glenn Hall, Leicester.

BARR'S FLOWER SEEDS FOR MAY SOWING.—Finest strains of Antirrhinums, Aquilegias, Campanulas, Canterbury Bells, Calceolarias, Cinerarias, Delphiniums, Hollyhocks, Lupins, Pansies, Primulas, Polyanthus, Stocks, Sweet Williams, Wallflowers, &c. Special list on application.—BARR & SONS, King Street, Covent Garden, London.

WATERER'S RHODODENDRONS, Alpines, Herbaceous Plants, Roses, Choice Flower and Vegetable Seeds. Lists free.—JOHN WATERER, SONS & CRISP, LIMITED, Bagshot, Surrey; and Twyford, Berks.

RIVERS' FRUIT TREES, Roses, Vines, Figs, Oranges and Orchard House trees are of first-class quality, and a large and select stock is always on view. Inspection invited. Price list post free on application.—THOS. RIVERS & SONS, The Nurseries, Sawbridgeworth, Herts.

WANTED, two JOURNEYMEN, one Inside, one Outside; wages 30s., bothy, &c.; 5s. extra for duty.—Apply J. C. IRELAND, Lynford Hall Gardens, Mundford, Norfolk.

WANTED, SECOND JOURNEYMAN (Inside); Fruit and Plant Houses. Also Young Man with experience in Rock Plants and Rhododendrons.—State wages (with bothy) and particulars of experience, to GEO. GURNEY, Bodnant Gardens, Taly-Cafn, N. Wales.

WANTED, several JOURNEYMEN for Pleasure Grounds; wages to commence 30s.; bothy and vegetables; duty and overtime extra; 1 o'clock Saturdays.—A. J. COBB, Duffryn Gardens, near Cardiff.

WANTED, two experienced JOURNEYMEN for Fruit and Plant Houses. Also one for Pleasure Ground; bothy, milk and vegetables.—Apply, stating full particulars and wages required, WILLIAM TURNHAM, Greenlands, Henley-on-Thames.

WANTED, several experienced JOURNEYMEN for Outside; wages, 32s. per week, bothy, vegetables and attendance; duty and overtime paid; 1 o'clock Saturdays. Also One or Two Improvers; 25s. per week.—Apply, stating experience and enclosing copies of testimonials, to W. ANTON, Pyrford Court, Woking.

WANTED, JOURNEYMAN, Indoor and Out, with experience in Carnations and Plants in general; wages 30s. per week; bothy, light and vegetables; duty alternate Sundays, which is paid for.—WILSON, Dunsmore Gardens, Rugby.

WANTED, JOURNEYMAN for Inside.—State age and experience, wages required with bothy, A. TALBOT, The Gardens, Staunton Park, Pembridge, Herefordshire.

WANTED, a JOURNEYMAN for the Houses; must have had good experience as a Plantsman; wages, 30s., bothy and vegetables; Sunday duty paid: 1 o'clock Saturdays.—State age and experience to W. L. BASTIN, Buscot Gardens, Faringdon, Berks.

WANTED, JOURNEYMAN for Pleasure Grounds and Kitchen Garden; 30s. per week, bothy and vegetables; able to take duty; extra for duty; 12 o'clock Saturdays.—State age, experience, A. H. CALEY, Huntroyde Gardens, Padiham, Lancs.

WANTED, JOURNEYMAN, indoors and out; bothy, usual allowances; 12 o'clock Saturdays; Sunday duty paid.—HEAD GARDENER, Aston Hall, Preston Brook, Warrington.

WANTED, two good JOURNEYMEN, one Inside, one Inside and Out, to take duties.—State age, experience and wages required, with bothy, milk and vegetables, to F. C. WARD, Wergs Hal. Gardens, Wolverhampton.

WANTED, OUTSIDE JOURNEYMAN, age about 22; state experience, and wages required, with bothy and vegetables; duty every third week.—J. MANN, Kirklington Hall Gardens, Southwell, Notts.

WANTED, JOURNEYMAN (FIRST) for Fruit Range; 32s.; bothy, etc.; duty and overtime paid; 1 o'clock Saturdays.—State age and experience to, N. J. EARL, The Gardens, Tranby Croft, Hull.

WANTED, two JOURNEYMEN for Inside and Out.—Please state age, experience, and wages required, with good bothy, etc., to T. WALKER, The Gardens, Locko Park, Derby.

WANTED, experienced JOURNEYMAN for Fruit and Plant Houses; wages 30s., bothy, milk and vegetables; 1 o'clock Saturday; duty paid.—H. PAGE, Stoke Place Gardens, Slough.

WANTED, three good JOURNEYMEN, one for Fruit and Plant Houses, also Decorating; two for Kitchen Garden or Lawns; comfortable bothy, with coal, milk, and vegetables.—State wages required, CHARLES BENNETT, Muckross Abbey Gardens, Killarney.

WANTED, JOURNEYMAN or IMPROVER (Inside); take duty.—State experience, wages (no bothy), F. D. REID, Manor Gardens, Swanland, Hull.

WANTED, an experienced MAN (single), to take charge of Houses, Fruit and Plants. Bothy, with heating, light, and attendance. State experience, age, and wages to HEAD GARDENER, The Lodge, Pasture Wood, Abinger, near Dorking.

WANTED, MAN to take charge of Pleasure Grounds; one used to machines and scythe, able to take duty; bothy provided.—R. LANKESTER, The Gardens, Wood Green Park, Cheshunt.

WANTED, a MAN to help in the Garden, milk two cows, make himself useful; cottage found.—Wages and particulars, H. GOOD, The Gardens, Manor House, Woodmansterne, Banstead, Surrey.

WANTED, good MAN for Lawns and Kitchen Garden, used to Horse Machine and Scythe; 33s. week, bothy, milk, and vegetables.—C. LEACH, The Gardens, Burn Hall, Durham.

WANTED, MARRIED MAN, understand Horses and Cattle, for gentleman's estate; wife to do dairy work; house found; no family preferred.—Apply, stating wages, experience, etc., J. H. COLEY, The Outwoods Gardens, Duffield, near Derby.

WANTED, a SINGLE MAN for Kitchen Garden and Pleasure Grounds; take duty; 30s. per week; rooms, coal and light.—F. JUSTIN, The Gardens, Abbotswood, Stow-on-the-Wold.

WANTED, SECOND MAN, chiefly Inside; understand Vines, Peaches, and good Plantsman; bothy, milk, vegetables.—Apply, stating wages, experience, etc., J. H. COLEY, The Outwoods Gardens, Duffield, near Derby.

WANTED, Outside MAN, pricipally for Kitchen Garden, Lawns occasionally; wages 35s., and three roomed cottage.—MR. GOSLING, The Gardens, Heddon Court, New Barnet.

WANTED, good MEN for Kitchen Garden Work; also Journeymen for Houses; no bothy. State age, wages, experience.—W. SEARLES, Southampton Lodge, Fitzroy Park, Highgate, N.

Important to Gardeners and Fruit Growers.—

"NIQUAS"
(IMPROVED)
(REGD.)

The Most Successful Non-poisonous Insecticide of the Day

Its advantages are—

Certain death to all Insect Pests.
No possible injury to the most delicate Plant, Flower or Foliage.
It is the cheapest Insecticide known.
One pint makes 10 to 12 gallons for Thrip, Black and Green Fly, etc., whilst RED SPIDER, Mealy Bug and Scale can be thoroughly eradicated by using "NIQUAS" about double the strength required for Fly.

PRICES.

Half-pint, 1/-; Pint, 1/9; Quart, 3/-; Half-gal., 5/-; Gallon, 8/9; Drums, each, Five Galls., 30/-; 10 Galls., 54/-; 20 Galls., 102/-.

To be had from the Trade generally.

RUNNER BEANS.

THE Runner Bean is a vegetable of great utility, and may be advantageously grown by all. To obtain the best results in crop and quality, abundant supplies of food and moisture are necessary, or the pods will be tough and flavourless. The Runner Bean is able to assimilate a large amount of plant food, and the results depend on the amount available in the soil. In this respect it differs from certain other crops of the kitchen garden. Onions, for example, grown on excessively rich soil, are not so fine in quality as when planted in moderately fertile ground, whilst roots of the culinary Pea will not tolerate animal manure in quantity. The Runner Bean is able to take full advantage of a rich rooting medium, and provided with plenty of manure it will grow rampantly and produce large quantities of its valuable pods.

By way of experiment, I have planted Runner Beans on manure heaps where they have thriven amazingly, the only difficulty being that sometimes the blooms dropped off instead of setting, but this was entirely rectified by two applications of sulphate of potash, at the rate of one ounce to one gallon of water. But I do not recommend growing the plants in rank manure only, for not only is such an extreme course unnecessary, it is obviously wasteful of manure. Fair crops may sometimes be obtained from plants grown in unmanured ground in average seasons, but if a period of drought occurs the crop will be poor and the pods tough and stringy.

For many reasons the trench system is undesirable; in heavy, damp soils, the trench acts as a drain in rainy weather, and the sinking caused by the decomposing manure causes many of the roots to become broken. It is a much better plan, if the necessary labour is available, to spread the manure over the ground and trench the land, placing most of the manure at the bottom of the trenches as the work of digging proceeds.

The root system of the Runner Bean develops to a large extent, laterally, and, on shallow soil, during wet weather, innumerable roots may be seen penetrating the surface for some distance from the plant. These roots generally perish in times of drought.

Deep cultivation should be practised to encourage the roots to grow into the moist soil below, where they will be safe from drought and the effects of hot sunshine. Generally, surface mulchings of manure are inadvisable on account of encouraging surface rooting, it being better to stir the surface soil frequently to create a dry mulch of dusty soil which the roots will not enter.

Surface mulchings may be advantageously applied in certain circumstances such as on heavy, wet soils where the ground is liable to crack, and which defy hoeing after a period of rain.

Many growers maintain that a light, dry mulch is beneficial during hot weather, a point I concede, provided the drought continues. In our variable climate it is impossible to forecast the weather for any considerable length of time; long periods of wet weather frequently follow drought. In such conditions the driest of light mulchings become sodden, and partly decay; the roots invariably enter such material and this entails the provision of another mulch for protection when drought returns. The only way of preventing this trouble is to remove the mulch when rains falls, a process too laborious for most gardeners to undertake. On light soils a light, dry mulch is easily obtained by frequently stirring the surface, a process which involves less labour and at the same time destroys weeds.

Water should not be applied unless absolutely necessary, as watering encourages roots to grow near the surface, even when the ground is thoroughly saturated. When water is applied, the soil should be saturated for a goodly depth below the surface. For supporting Runner Beans stakes, wire netting, twine, and twine netting, are all useful, the choice depending on circumstances. The support should be secured firmly to stout poles at the ends of the rows, and if necessary at intervals between, and they should be placed in position before planting the seedlings or sowing the seeds. *E. Janes.*

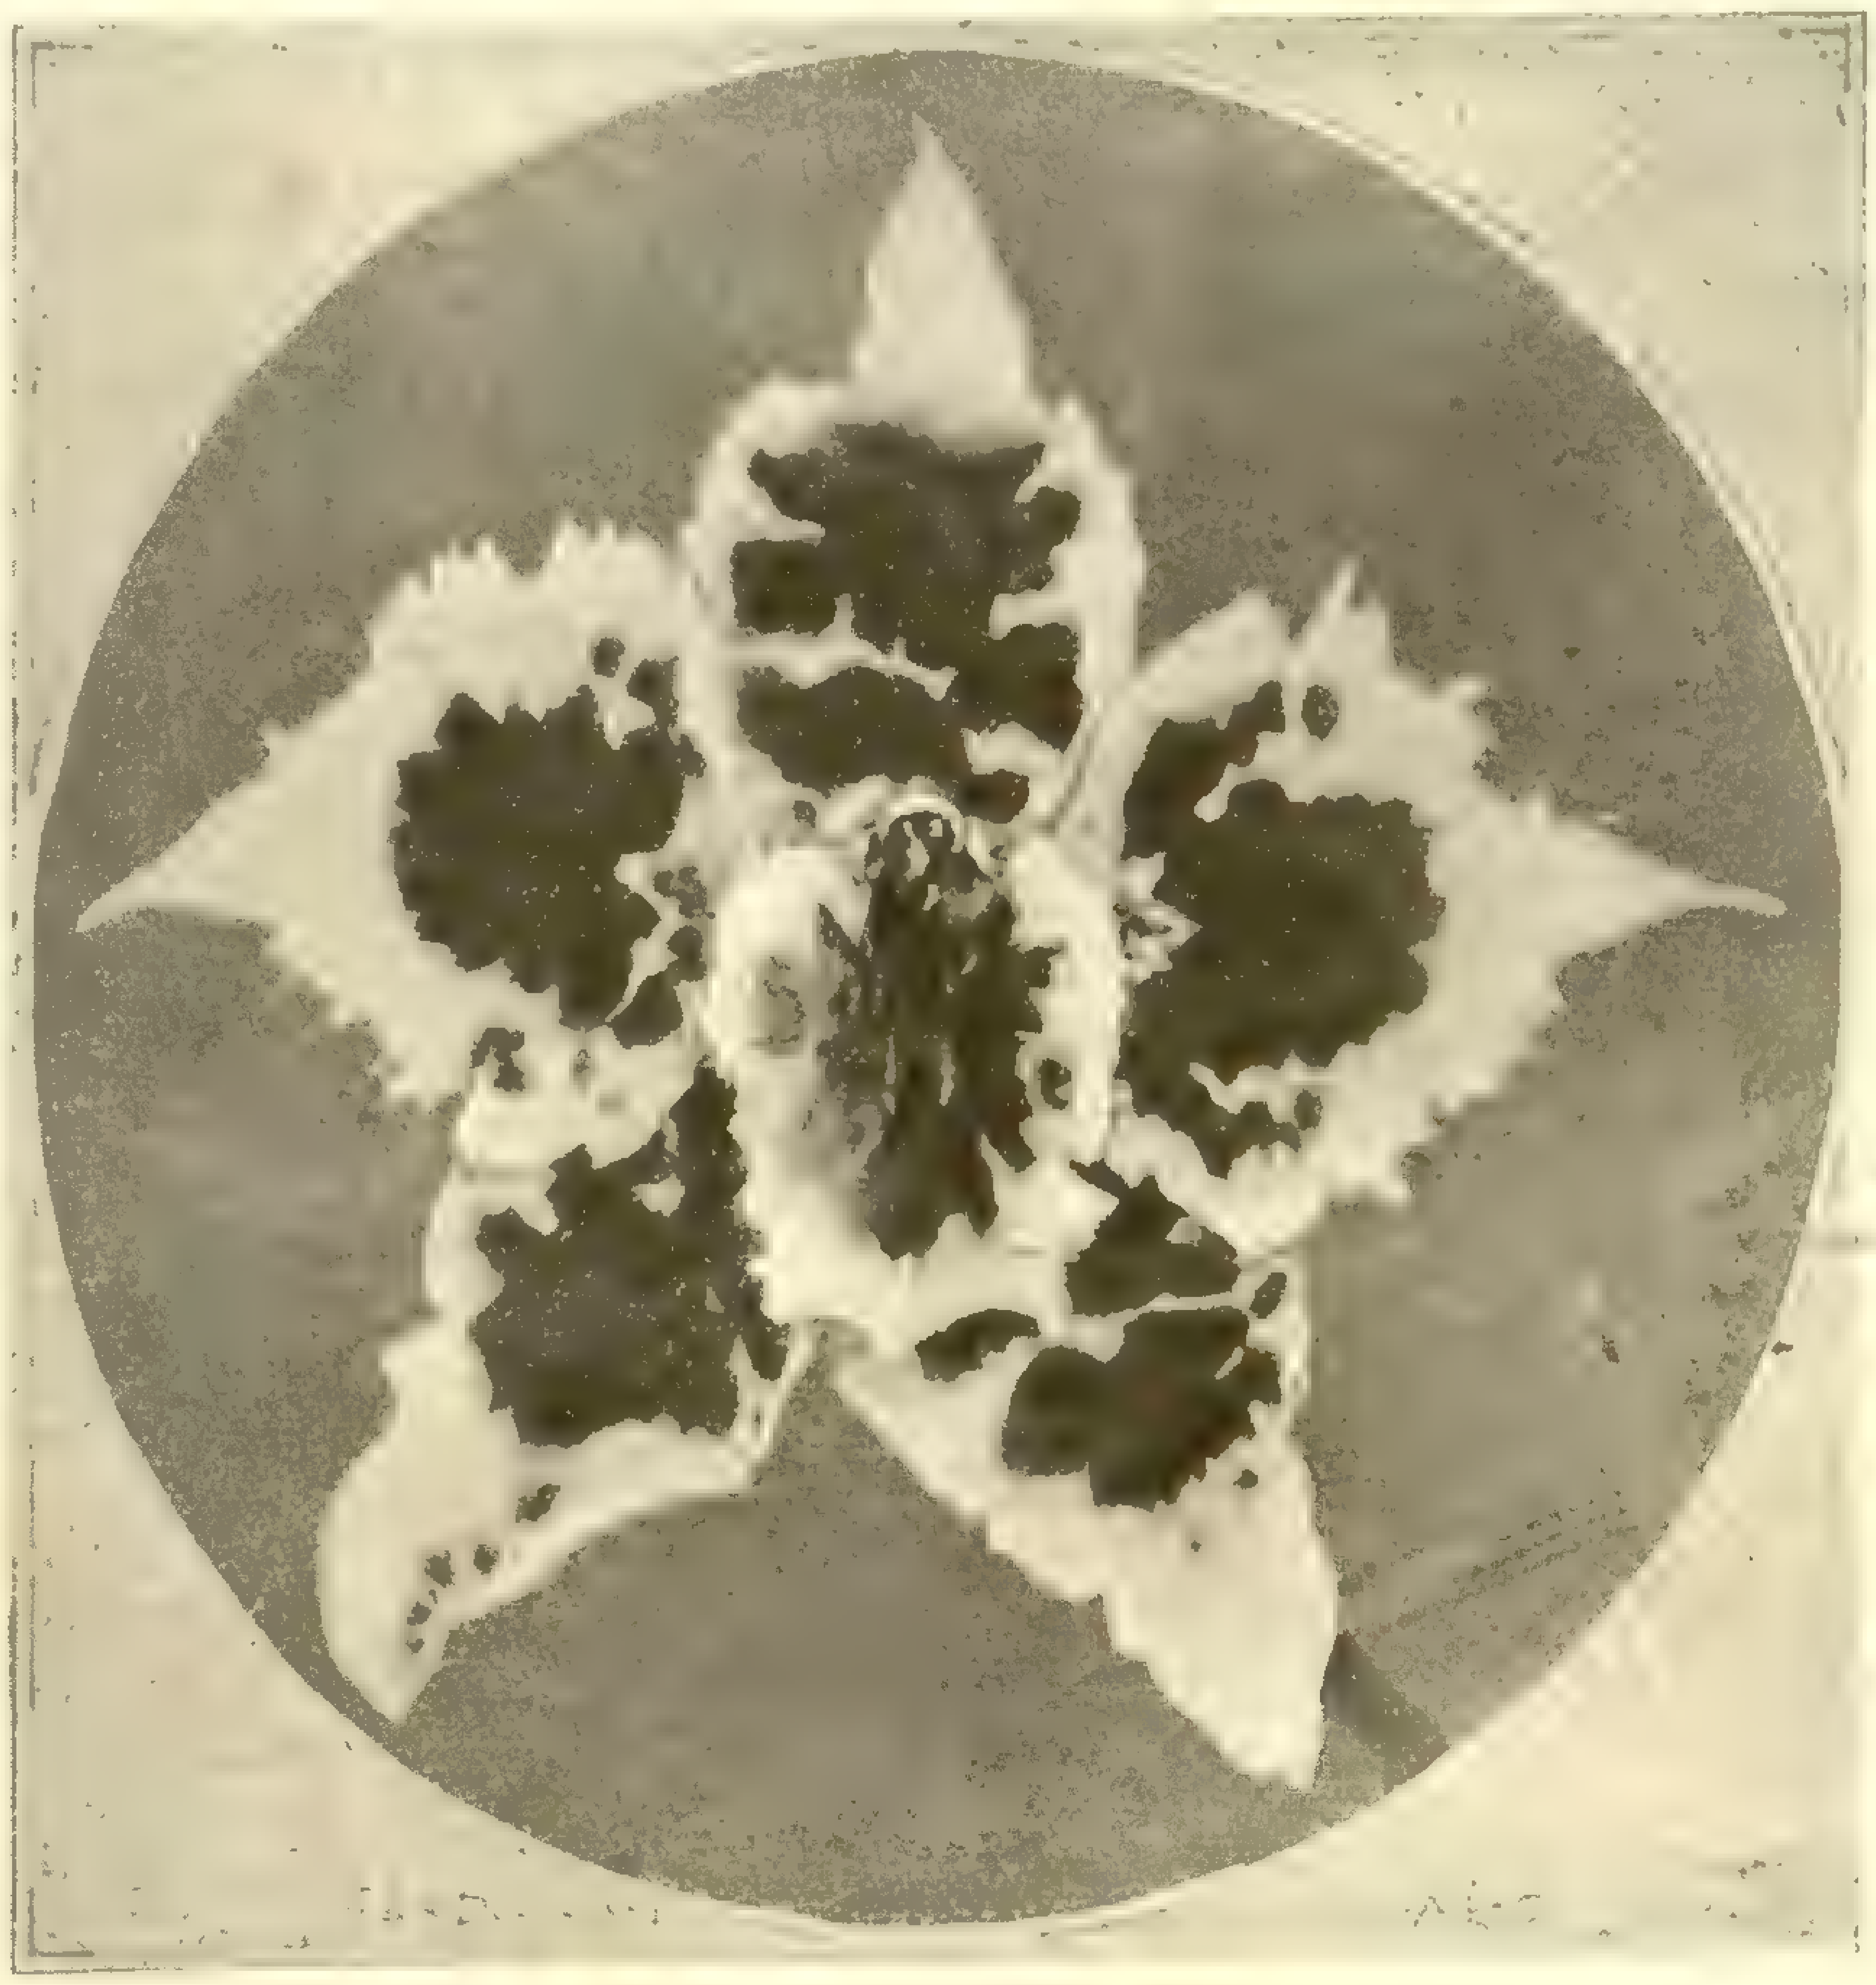

FIG. 113.—ODONTOGLOSSUM CRISPUM VAR. PITTIANUM, KNOWN AS THE "THOUSAND GUINEA" ODONTOGLOSSUM.
(See page 236)

FLORISTS' FLOWERS.

HERBACEOUS CALCEOLARIAS.

AMONG the many beautiful flowering plants that are raised annually from seed for conservatory decoration, none is more showy than the Herbaceous Calceolaria.

To obtain a good display of flowering plants during May and June great care must be taken with their cultivation. It is not that they call for extraordinary attention, but once they receive a check they never appear to get over it however careful the grower may be in trying to remedy the defect. On the contrary, they quickly respond to intelligent treatment.

For ordinary purposes the early part of June is a suitable time for sowing the seed. Well drained pans should be filled with a light, open compost and the seeds sown thinly. If the pans are placed in a cool, moist house or frame the seedlings will appear in about eight days, when they should be placed close to the roof glass, but shaded from direct sunshine. Later they should be transferred to boxes and grown in a cold frame. Do not discard the smaller plants, as generally these give the most

brightly-coloured flowers. Before the seedlings become crowded in the pans pot them in 3-inch pots and stand the pots on a bed of ashes in a frame. Attend carefully to necessary details, and ventilate the frame freely in fine weather. Keep the surrounding of the plants moist, and shade them from hot sunshine. Transfer them to 5-inch pots when they are large enough, using a slightly heavier compost than before, with coarse sand freely added to keep it open. Do not make the soil very firm when potting. After repotting keep the frame closed for a few days, and shaded rather heavily in bright weather.

Towards the end of September remove the plants to a heated pit, and keep them growing steadily in a temperature of between 45° and 50°. Careful watering is essential during dull days. Let the frame be freely ventilated in suitable weather, and keep aphides in check. The plants will make good progress with the turn of the year, and in February the final potting should be done. Employ a fairly rich and open compost, using 7 inch pots for the best plants. With careful watering until the roots are active in the new soil healthy growth will follow with the lengthening days, and when the flower spikes begin to push up light feeding with concentrated fertilisers will be beneficial.

Before removing the plants to the conservatory let the whole stock be fumigated on two nights in succession to destroy any aphides that may be present on them. *F. T.*

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISPUM.

IGNORING all side issues it can definitely be said that Odontoglossum crispum, first discovered by Hartweg in 1841-2 in the province of Bogota, New Granada, but not imported until after 1863, when Weir, Blunt and Schlim, in separate interests, made the journey simultaneously, is the most beautiful Odontoglossum and the one whose advent had the greatest and most satisfactory results in gardens, whether it is considered for its beauty and wonderful variation as an introduced plant, or for the important part which it has played in the hands of the hybridiser.

The species, shown as O. Alexandrae, was first exhibited before the Royal Horticultural Society on April 18, 1865, and, although there were many plants in the country it failed to show its real character on account of its requirements not being then so well understood as they have been later. In its season, O. crispum is one of the best represented Orchids in gardens; it is beautiful in all its forms, and shows such amazing variation that about two hundred varieties have been considered to be sufficiently distinct by the Orchid Committee of the Royal Horticultural Society to warrant the giving of awards, the variation being from the pure white, which is regarded as the typical form and entitled to specific rank, to the heavily blotched varieties in which colour predominates, and which a few years ago were eagerly sought by collectors and realised at auction hundreds of pounds each. High prices were given not only on account of the beauty of the specimen, but because each of the best forms was unique.
